Figure S1 The buccal neck of the implant is at least 2 mm palatal to the buccal contour of the neighboring teeth. The neck of the implant was flush with the palatal bone in an apico-coronal direction.

Figure S2 Allograft material was applied in the residual gap and above the buccal wall.
Figure S3 A resorbable collagen membrane was applied after adaptation of an appropriate transfer abutment.

Figure S4 A coronally positioned flap was performed after a periosteal releasing incision.
