

**Supplemental Figure S1.** Breast cancer patient tumor sections, pre- and post-current standard-of-care-treatments (ACT, TCHP and TC), were examined by dual-immunohistochemical staining against a background of Nodal (brown) and ABCA1 (red), black arrows point to dual stained (brown-red) cells demonstrating a colocalization of Nodal and ABCA1. IgG was used as a control for non-specific staining (X20 original magnification).
