\textsuperscript{a}: LoA (Level of Assignment); 1: Accurate mass matched to database-Tentative assignment, 2: Accurate mass matched to database and tandem MS spectrum matched to \textit{in silico} fragmentation pattern, 3: Tandem MS spectrum matched to database or literature, 4: RT matched to standard compound, 5: MS/MS spectrum matched to standard compound.

\textsuperscript{b}: Annotation via automated dereplication; \textsuperscript{a}: Annotation via manual dereplication

Automated dereplication was performed on GNPS platform. Manual dereplication was performed considering the parent mass, biological source, retention time, elemental composition analysis, and predicated fragmentation patterns.

The MS\textsuperscript{2} fragmentation pattern of a molecule was predicated on the Competitive Fragmentation Modeling for Metabolite Identification (CFM-ID) platform (http://cfmid.wishartlab.com) and compared with our experimental data.
Figure S1. Global molecular networking of the CHCl₃ subextract (KC) of *Axinella sinoxea*.

Blue nodes represent phospholipids and green nodes represent steroids. The thickness of the edges indicates the similarity of the nodes. The numbers within the nodes represent parent ions. Square nodes represent putatively new compounds. Gray nodes could not be annotated to any known chemical classes either by automated or manual dereplication. All molecules from clusters A1 and B1 were annotated to be the same as those in the global MN of the crude extract of *Axinella sinoxea* (Table S1).
