Abstract: In the paper, we give some new improvements of the Kantorovich type inequalities by using Popoviciu’s, Hölder’s, Bellman’s and Minkowski’s inequalities. These results in special case yield Hao’s, reverse Cauchy’s and Minkowski’s inequalities.

Keywords: Popoviciu’s inequality; Bellman’s inequality; Hölder’s weighted inequality; Minkowski’s inequality

2010 Mathematics Subject Classification: 26D15

1. Introduction

The Pólya–Szegö’s inequality can be stated as follows ([1] or ([2], p. 62)). If $u_k$ and $v_k$ are non-negative real sequences, and $0 < m_1 \leq u_k \leq M_1$, and $0 < m_2 \leq v_k \leq M_2$ for $k = 1, 2, \ldots, n$, then

$$\sum_{k=1}^{n} u_k^2 \sum_{k=1}^{n} v_k^2 \leq \frac{(M_1 M_2 + m_1 m_2)^2}{4m_1 m_2 M_1 M_2} \left(\sum_{k=1}^{n} u_k v_k\right)^2.$$ (1)

The Pólya–Szegö’s inequality was studied extensively and numerous variants, generalizations, and extensions appeared in the literature (see [3–6] and the references cited therein). The integral forms of Pólya–Szegö’s inequality were recently established in [7–10]. The weighted version of inequality (1) was proved in papers of Watson [11] and Greub and Rheinboldt [12]:

$$\sum_{k=1}^{n} \omega_k u_k^2 \cdot \sum_{k=1}^{n} \omega_k v_k^2 \leq \frac{(M_1 M_2 + m_1 m_2)^2}{4m_1 m_2 M_1 M_2} \left(\sum_{k=1}^{n} \omega_k u_k v_k\right)^2,$$ (2)

where $\omega_k$ is a nonnegative $n$-tuple.

An interesting generalization of Kantorovich type inequality was given by Hao ([13], p. 122), so we shall give his result:

$$\left(\sum_{k=1}^{n} \omega_k u_k^2\right)^{1/p} \cdot \left(\sum_{k=1}^{n} \omega_k v_k^2\right)^{1/q} \leq \ell \left(\sum_{k=1}^{n} \omega_k u_k v_k\right),$$ (3)

where $0 < \frac{1}{q} \leq \frac{1}{p} < 1$ and $\frac{1}{p} + \frac{1}{q} = 1$, and

$$\ell = \frac{qM_1 M_2 + pm_1 m_2}{pq(m_1 M_1)^{1/q}(m_2 M_2)^{1/p}}.$$ (4)

We recall that, with the name “Kantorovich”, we also usually refer to some integral-type extension of classical inequalities, classical pointwise operators, and other mathematical tools—see, e.g., [14–17].
We combine organically Popoviciu’s, Hölder’s, and Hao’s inequalities to derive a new inequality, which is a generalization of Label (3).

Corresponding to (3), we can obtain a reverse Minkowski’s inequality as follows:

\[
\ell \left( \sum_{k=1}^{n} \omega_k (u_k + v_k)^2 \right)^{1/p} \geq \left( \sum_{k=1}^{n} \omega_k u_k^2 \right)^{1/p} + \left( \sum_{k=1}^{n} \omega_k v_k^2 \right)^{1/p},
\]

where \( p, q, \omega_k, u_k, v_k \) are as in (3), and \( \ell \) is defined in (4).

Another aim of this paper is to give a new reverse Minkowski’s inequality. We combine organically Bellman’s and Minkowski’s inequalities to derive a new inequality, which is generalization of the reverse Minkowski’s inequality (5).

2. Results

We need the following Lemmas to prove our main results.

**Lemma 1.** (Popoviciu’s inequality) ([18], p. 58) Let \( p > 0, q > 0, \frac{1}{p} + \frac{1}{q} = 1 \), and \( a = \{a_1, \ldots, a_n\} \) and \( b = \{b_1, \ldots, b_n\} \) be two series of positive real numbers and such that \( a_p^1 - \sum_{i=2}^{n} a_i^p > 0 \) and \( b_q^1 - \sum_{i=2}^{n} b_i^q > 0 \). Then,

\[
\left( a_1^p - \sum_{i=2}^{n} a_i^p \right)^{1/p} \left( b_1^q - \sum_{i=2}^{n} b_i^q \right)^{1/q} \leq a_1 b_1 - \sum_{i=2}^{n} a_i b_i,
\]

with equality if and only if \( a = \mu b \), where \( \mu \) is a constant.

**Lemma 2.** (Bellman’s inequality) ([19], p. 38) Let \( a = \{a_1, \ldots, a_n\} \) and \( b = \{b_1, \ldots, b_n\} \) be two series of positive real numbers and \( p > 1 \) such that \( a_p^1 - \sum_{i=2}^{n} a_i^p > 0 \) and \( b_q^1 - \sum_{i=2}^{n} b_i^q > 0 \), then

\[
\left( a_1^p - \sum_{i=2}^{n} a_i^p \right)^{1/p} + \left( b_1^q - \sum_{i=2}^{n} b_i^q \right)^{1/q} \leq \left( a_1 b_1 + (a_1 + b_1)^p \right)^{1/p} - \sum_{i=2}^{n} (a_i + b_i)^p,
\]

with equality if and only if \( a = \nu b \), where \( \nu \) is a constant.

**Lemma 3.** (Hölder’s weighted inequality) ([13], p. 100) Let \( p > 0, q > 0, \frac{1}{p} + \frac{1}{q} = 1 \), and \( a_k, b_k \) and \( \omega_k \) be non-negative real numbers, then

\[
\sum_{k=1}^{n} \omega_k a_k b_k \leq \left( \sum_{k=1}^{n} \omega_k a_k^p \right)^{1/p} \left( \sum_{k=1}^{n} \omega_k b_k^q \right)^{1/q}.
\]

**Lemma 4.** Let \( 0 < \frac{1}{q} \leq \frac{1}{p} < 1 \) and \( \frac{1}{p} + \frac{1}{q} = 1 \). If \( u_k, v(k) \) and \( \omega_k \) are non-negative real sequences, and \( 0 < u_k \leq u_1 \leq M_1, \) and \( 0 < v_k \leq v_1 \leq M_2 \) for \( k = 1, 2, \ldots, n \), then

\[
\ell \left( \sum_{k=1}^{n} \omega_k (u_k + v_k)^2 \right)^{1/p} \geq \left( \sum_{k=1}^{n} \omega_k u_k^2 \right)^{1/p} + \left( \sum_{k=1}^{n} \omega_k v_k^2 \right)^{1/p},
\]

where \( \ell \) is as in Label (4).
Theorem 1. Let $m \in \mathbb{N}^+$, $0 < \frac{1}{q} \leq \frac{1}{p} < 1$ and $\frac{1}{p} + \frac{1}{q} = 1$. Let $u_k, v_k, a_k, b_k, \omega_k$ and $\mu_k$ be non-negative real sequences such as $\omega_k u_k^2 > m \mu_k a_k^p$ and $\omega_k v_k^2 > m \mu_k b_k^q$ where $k = 1, 2, \ldots, n$. If $0 < m_1 \leq u_k \leq M_1$ and $0 < m_2 \leq v_k \leq M_2$, then
\[
\sum_{k=1}^{n} (\ell \omega_k u_k v_k - m \mu_k a_k b_k) \geq \left( \sum_{k=1}^{n} \omega_k u_k^2 - m \mu_k a_k^p \right)^{1/p} \left( \sum_{k=1}^{n} \omega_k v_k^2 - m \mu_k b_k^q \right)^{1/q},
\] (10)
where $\ell$ is as in (4).

Proof. Let’s prove this theorem by mathematical induction for $m$. First, we prove that (10) holds for $m = 1$. From (3) and (8), we obtain
\[
\ell \left( \sum_{k=1}^{n} \omega_k u_k v_k \right) \geq \left( \sum_{k=1}^{n} \omega_k u_k^2 \right)^{1/p} \left( \sum_{k=1}^{n} \omega_k v_k^2 \right)^{1/q},
\] (11)
and
\[
\left( \sum_{k=1}^{n} \mu_k a_k b_k \right) \leq \left( \sum_{k=1}^{n} \mu_k a_k^p \right)^{1/p} \left( \sum_{k=1}^{n} \mu_k b_k^q \right)^{1/q}.
\] (12)
From (11), (12) and, in view of the Popoviciu’s inequality, we have
\[
\sum_{k=1}^{n} (\ell \omega_k u_k v_k - \mu_k a_k b_k) \geq \left( \sum_{k=1}^{n} \omega_k u_k^2 \right)^{1/p} \left( \sum_{k=1}^{n} \omega_k v_k^2 \right)^{1/q} - \left( \sum_{k=1}^{n} \mu_k a_k^p \right)^{1/p} \left( \sum_{k=1}^{n} \mu_k b_k^q \right)^{1/q}
\leq \left( \sum_{k=1}^{n} (\omega_k u_k^2 - \mu_k a_k^p) \right)^{1/p} \left( \sum_{k=1}^{n} (\omega_k v_k^2 - \mu_k b_k^q) \right)^{1/q}.
\]
This shows (10) right for $m = 1$.
Suppose that (10) holds when $m = r - 1$; we have
\[
\sum_{k=1}^{n} (\ell \omega_k u_k v_k - (r-1) \mu_k a_k b_k) \geq \left( \sum_{k=1}^{n} (\omega_k u_k^2 - (r-1) \mu_k a_k^p) \right)^{1/p} \left( \sum_{k=1}^{n} (\omega_k v_k^2 - (r-1) \mu_k b_k^q) \right)^{1/q}.
\] (13)
From (6), (12) and (13), we obtain
\[
\sum_{k=1}^{n} (\ell \omega_k u_k v_k - r \mu_k a_k b_k) \geq \left( \sum_{k=1}^{n} (\omega_k u_k^2 - (r-1)\mu_k a_k^p) \right)^{1/p} \left( \sum_{k=1}^{n} (\omega_k v_k^2 - (r-1)\mu_k b_k^p) \right)^{1/q} - \left( \sum_{k=1}^{n} \mu_k a_k^p \right)^{1/p} \left( \sum_{k=1}^{n} \mu_k b_k^p \right)^{1/q} \geq \left( \sum_{k=1}^{n} (\omega_k u_k^2 - r\mu_k a_k^p) \right)^{1/p} \left( \sum_{k=1}^{n} (\omega_k v_k^2 - r\mu_k b_k^p) \right)^{1/q}.
\]
This shows that (10) is correct if \( m = r - 1 \), then \( m = r \) is also correct. Hence, (10) is right for any \( m \in \mathbb{N}^+ \).

This proof is complete. \( \square \)

Taking \( m = 1 \) and \( \omega_k = \mu_k \) in Theorem 1, we have the following result.

**Corollary 1.** Let \( p, q, u_k, v_k, a_k, b_k \) and \( \omega_k \) are as in Theorem 1, then
\[
\sum_{k=1}^{n} (\omega_k (\ell u_k v_k - a_k b_k)) \geq \left( \sum_{k=1}^{n} \omega_k (u_k^2 - a_k^p) \right)^{1/p} \left( \sum_{k=1}^{n} \omega_k (v_k^2 - b_k^p) \right)^{1/q},
\]
where \( \ell \) is as in (4).

Taking \( m = 1, p = q = 2 \) and \( \omega_k = \mu_k = 1 \) in Theorem 1, we have the following result.

**Corollary 2.** Let \( u_k, v_k, a_k, b_k \) are as in Theorem 1, then
\[
\sum_{k=1}^{n} \left( M_1 M_2 + m_1 m_2 \sqrt{m_1 M_1 M_2} u_k v_k - a_k b_k \right) \geq \left( \sum_{k=1}^{n} (u_k^2 - a_k^2) \right)^{1/2} \left( \sum_{k=1}^{n} (v_k^2 - b_k^2) \right)^{1/2}. \tag{14}
\]

Taking for \( a_k = 0 \) and \( b_k = 0 \) in (14), we get the following interesting reverse Cauchy’s inequality.
\[
\frac{M_1 M_2 + m_1 m_2}{2\sqrt{m_1 m_2 M_1 M_2}} \sum_{k=1}^{n} u_k v_k \geq \left( \sum_{k=1}^{n} u_k^2 \right)^{1/2} \left( \sum_{k=1}^{n} v_k^2 \right)^{1/2}.
\]

**Theorem 2.** Let \( m, n \in \mathbb{N}^+, \ 0 < \frac{1}{q} \leq \frac{1}{p} < 1 \) and \( \frac{1}{p} + \frac{1}{q} = 1 \). Let \( u_k, v_k, a_k, b_k, \omega_k \) and \( \mu_k \) be non-negative real sequences such as \( \omega_k u_k^2 > m \mu_k a_k^p \) and \( \omega_k v_k^2 > m \mu_k b_k^p \), where \( k = 1, 2, \ldots, n \). If \( 0 < m_1 \leq u_k \leq M_1 \) and \( 0 < m_2 \leq v_k \leq M_2 \), then
\[
\left( \sum_{k=1}^{n} (\ell \omega_k (u_k + v_k)^2 - m(a_k + b_k)^p) \right)^{1/p} \geq \left( \sum_{k=1}^{n} (\omega_k u_k^2 - m \mu_k a_k^p) \right)^{1/p} + \left( \sum_{k=1}^{n} (\omega_k v_k^2 - m \mu_k b_k^p) \right)^{1/p}, \tag{15}
\]
where \( \ell \) is as in (4).

**Proof.** First, we prove that (15) holds for \( m = 1 \). From (9) and in view of Minkowski’s inequality, it is easy to obtain
\[
\ell \left( \sum_{k=1}^{n} \omega_k (u_k + v_k)^2 \right)^{1/p} \geq \left( \sum_{k=1}^{n} \omega_k u_k^2 \right)^{1/p} + \left( \sum_{k=1}^{n} \omega_k v_k^2 \right)^{1/p}, \tag{16}
\]
and
\[
\left( \sum_{k=1}^{n} (a_k + b_k)^p dx \right)^{1/p} \leq \left( \sum_{k=1}^{n} a_k^p \right)^{1/p} + \left( \sum_{k=1}^{n} b_k^p \right)^{1/p}.
\] (17)

From (16), (17) and the Bellman’s inequality, we have
\[
\left( \sum_{k=1}^{n} \left( \ell^p \omega_k (u_k + v_k)^2 - (a_k + b_k)^p \right) \right)^{1/p}
\geq \left\{ \left[ \left( \sum_{k=1}^{n} \omega_k u_k^2 \right)^{1/p} + \left( \sum_{k=1}^{n} \omega_k v_k^2 \right)^{1/p} \right] - \left[ \left( \sum_{k=1}^{n} a_k^p \right)^{1/p} + \left( \sum_{k=1}^{n} b_k^p \right)^{1/p} \right] \right\}^{1/p}
\geq \left( \sum_{k=1}^{n} (\omega_k u_k^2 - a_k^p) \right)^{1/p} + \left( \sum_{k=1}^{n} (\omega_k v_k^2 - b_k^p) \right)^{1/p}.
\]

This shows that (15) holds for \( m = 1 \)
Supposing that (15) holds when \( m = r - 1 \), we have
\[
\left( \sum_{k=1}^{n} \left( \ell^p \omega_k (u_k + v_k)^2 - (r - 1)(a_k + b_k)^2 \right) \right)^{1/p}
\geq \left( \sum_{k=1}^{n} (\omega_k u_k^2 - (r - 1)a_k^p) \right)^{1/p} + \left( \sum_{k=1}^{n} (\omega_k v_k^2 - (r - 1)b_k^p) \right)^{1/p}.
\] (18)

From (17), (18) and by using the Bellman’s inequality again, we obtain
\[
\left( \sum_{k=1}^{n} \left( \ell^p \omega_k (u_k + v_k)^2 - r(a_k + b_k)^2 \right) \right)^{1/p}
\geq \left\{ \left[ \left( \sum_{k=1}^{n} (\omega_k u_k^2 - (r - 1)a_k^p) \right)^{1/p} + \left( \sum_{k=1}^{n} \omega_k v_k^2 \right)^{1/p} \right] - \left[ \left( \sum_{k=1}^{n} a_k^p \right)^{1/p} + \left( \sum_{k=1}^{n} b_k^p \right)^{1/p} \right] \right\}^{1/p}
\geq \left( \sum_{k=1}^{n} (\omega_k u_k^2 - r a_k^p) \right)^{1/p} + \left( \sum_{k=1}^{n} (\omega_k v_k^2 - r b_k^p) \right)^{1/p}.
\]

This shows that (15) is correct if \( m = r - 1 \), then \( m = r \) is also correct. Hence, (15) is right for any \( m \in \mathbb{N}^+ \).
This proof is complete. \( \square \)

Taking for \( m = 1, p = 2 \) and \( \omega = 1 \), we have the following result.

Corollary 3. Let \( u_k, v_k, a_k, b_k, m_1, m_2, M_1, \) and \( M_2 \) be as in Theorem 2, then
\[
\left[ \sum_{k=1}^{n} \left( h(u_k + v_k)^2 - (a_k + b_k)^2 \right) \right]^{1/2} \geq \left( \sum_{k=1}^{n} (u_k^2 - a_k^2) \right)^{1/2} + \left( \sum_{k=1}^{n} (v_k^2 - b_k^2) \right)^{1/2},
\]
where
\[
h = \frac{(M_1 M_2 + m_1 m_2)^2}{4m_1 m_2 M_1 M_2}.
\]
