Abstract: In this note, we give a characterization of a class of minimal translation graphs generated by planar curves. Precisely, we prove that a hypersurface that can be written as the sum of $n$ planar curves is either a hyperplane or a cylinder on the generalized Scherk surface. This result can be considered as a generalization of the results on minimal translation hypersurfaces due to Dillen–Verstraelen–Zafindratafa in 1991 and minimal translation surfaces due to Liu–Yu in 2013.

Keywords: translation hypersurfaces; minimal hypersurfaces; Scherk surface

1. Introduction

The study of minimal hypersurfaces has a very long history. Many interesting and important results on minimal hypersurfaces in various ambient spaces have appeared in the past several centuries. From the view of differential geometry, one of the most interesting problems concerning the study of minimal hypersurfaces is to construct concrete examples of minimal hypersurfaces.

A hypersurface $M^n \subset \mathbb{R}^{n+1}$ is called a translation hypersurface if $M^n$ is a graph of a function

$$F(x_1, \ldots, x_n) = f_1(x_1) + \cdots + f_n(x_n),$$

where each $f_i$ is a smooth function of one real variable for $i = 1, 2, \ldots, n$.

Dillen, Verstraelen, and Zafindratafa [1] in 1991 proved the following interesting result.

**Theorem 1.** Let $M^n$ be a minimal translation hypersurface in $\mathbb{R}^{n+1}$. Then, $M^n$ is either a hyperplane or $M^n = \sum \times \mathbb{R}^{n-2}$, where $\sum$ is Scherk’s minimal translation surface in $\mathbb{R}^3$.

Scherk’s minimal translation surface takes the following parameterization:

$$F(x_1, x_2) = \frac{1}{a} \ln \frac{\cos(ax_1)}{\cos(ax_2)},$$

where $a$ is a nonzero constant. We recall that Scherk [2] in 1835 proved that, besides the plane, the only minimal translation surface is Scherk’s surface.

Recently, Liu and Yu in [6] introduced a class of translation surfaces given by a graph of a function as follows:

$$F(x_1, x_2) = f(x_1) + g(ax_1 + x_2)$$
for some nonzero constant $a$ and differentiable functions $f, g$. Such a surfaces is called an affine translation surface. Note that in the case $a = 0$, the affine translation surfaces become the classical translation surfaces. In fact, this new class of translation surfaces is also generated by planar curves. The readers may refer to [7]. Moreover, Liu and Yu proved the following theorem.

**Theorem 2.** Besides the plane, the only minimal affine translation surface in Euclidean three-space $E^3$ is the surface given by:

$$F(x_1, x_2) = \frac{1}{c} \ln \left| \frac{\cos(c \sqrt{1 + a^2 x_1})}{\cos(c(ax_1 + x_2))} \right|,$$

where $a, c$ are constants and $ac \neq 0$.

Since this surface (1) is similar to the classical Scherk surface, we call (1) a generalized Scherk surface or an affine Scherk surface (see [8,9]).

A translation surface $M \in \mathbb{R}^3$ could be expressed as a general form $\phi(s, t) = \alpha(s) + \beta(t)$, where $\alpha : I \subset \mathbb{R} \to \mathbb{R}^3$ and $\beta : J \subset \mathbb{R} \to \mathbb{R}^3$ are two regular curves with $\alpha'(s) \times \beta'(t) \neq 0$, which are called generators of $M$. In 1998, Dillen et al. [7] proved that if $M$ is minimal and $\alpha$ is a planar curve, then $\beta$ must be a planar curve; furthermore, $M$ is a plane or a generalized Scherk surface. In the case that minimal translation surfaces whose generators are both non-planar curves, very recently, López and Perdomo [10] completely solved the problem of characterizing all minimal translation surfaces of $\mathbb{R}^3$ in terms of the curvature and torsion of the generating curves.

In the two-dimensional situation, the study of geometric quantities on translation surfaces has a rich literature. Liu [11] provided a complete classification of translation surfaces with constant mean curvature in Euclidean three-space and the Lorentz–Minkowski three-space. Inoguchi, Lopez, and Munteanu [12,13] made important contributions to minimal translation surfaces in ambient spaces $Nil_3$ and $Sol_3$. For more recent results and progress on translation surfaces or translation hypersurfaces, see [14–19].

Motivated by the works mentioned above, in this paper, we consider a class of translation hypersurfaces in a Euclidean space $\mathbb{R}^{n+1}$ defined as follows.

**Definition 1.** We say that a hypersurface $M^n$ of the Euclidean space $\mathbb{R}^{n+1}$ is a translation graph if it is the graph of a function given by:

$$F(x_1, \cdots, x_n) = f_1(x_1) + \cdots + f_{n-1}(x_{n-1}) + f_n(u),$$

where $u = \sum_{i=1}^{n-1} c_i x_i$, $c_i$ are constants, $c_n \neq 0$, and each $f_i$ is a smooth function of one real variable for $i = 1, 2, \cdots, n$.

We remark that this definition of a translation graph is an extension of the definitions due to Dillen et al. [1] for a hypersurface and Liu–Yu [6] for a surface in a Euclidean space.

In this note, we study the minimality of translation graphs and give a characterization of such hypersurfaces in $\mathbb{R}^{n+1}$. Precisely, we obtain the following theorem.

**Theorem 3.** Let $M^n$ be a minimal translation graph in $\mathbb{R}^{n+1}$. Then, $M^n$ is either a hyperplane or $M^n = \sum \times \mathbb{R}^{n-2}$, where $\sum$ is a generalized Scherk’s minimal translation surface in $\mathbb{R}^3$.

**Remark 1.** It is easy to see that Theorem 3 is a natural generalization of Dillen et al. and Liu–Yu’s results in Theorems 1 and 2, respectively.

Analogous problems were considered in [20,21]. In addition, Sağlam, Soytürk, and Sabuncuoğlu gave a connection of minimal translation surfaces with geodesic planes, and Hasanis and López gave
the classification of minimal translation surfaces in Euclidean space. The present paper is close to the research of Belova, Mikeš, and Strambach [22–25], where similar methods for investigations of geodesics and almost geodesics were used.

2. The Proof of Theorem 3

We first recall some basic background material for a graph of a hypersurface in a Euclidean space. Let \( M^n \) be a hypersurface immersed in \( \mathbb{R}^{n+1} \) given by:

\[
L(x_1, \ldots, x_n) = \left( x_1, \ldots, x_n, F(x_1, \ldots, x_n) \right).
\]

Denote the partial derivatives \( \frac{\partial F}{\partial x_i}, \frac{\partial^2 F}{\partial x_i \partial x_j}, \ldots \), etc., by \( F_i, F_{ij}, \ldots \), etc. Put \( W = \sqrt{1 + \sum_{i=1}^{n} F_i^2} \). It is easy to check that the unit normal \( \xi \) is given by:

\[
\xi = \frac{1}{W} (-F_1, \ldots, -F_n, 1),
\]

and the coefficient \( g_{ij} = g \left( \frac{\partial}{\partial x_i}, \frac{\partial}{\partial x_j} \right) \) of the metric tensor is given by:

\[
g_{ij} = \delta_{ij} + F_i F_j,
\]

where \( \delta_{ij} \) is the Kronecker symbol. Moreover, the matrix of the second fundamental form \( h \) is given by relation:

\[
h_{ij} = \frac{F_{ij}}{W}.
\]

Hence, the components of the matrix of the shape operator \( A \) are:

\[
a^j_i = \sum_k h_{ik} g^{kj} = \frac{1}{W} (F_{ij} - \sum_k F_{ik} F_{kj} \frac{F_i F_j}{W^2}).
\]

Then, the mean curvature \( H \) is given by:

\[
H = \frac{1}{nW} \left( \sum_i F_{ii} - \frac{1}{W^2} \sum_{ij} F_i F_j F_{ij} \right). \tag{2}
\]

From (2), the following result could be deduced directly.

**Proposition 1.** Let \( M^n \) be a graph immersed in \( \mathbb{R}^{n+1} \) given by:

\[
L(x_1, \ldots, x_n) = \left( x_1, \ldots, x_n, F(x_1, \ldots, x_n) \right).
\]

Then, the graph \( M^n \) is minimal if and only if:

\[
\sum_i F_{ii} + \sum_{\substack{i, j=1 \atop i \neq j}}^n (F_i^2 F_{jj} - F_i F_j F_{ij}) = 0. \tag{3}
\]

We remark that the above result is necessary and crucial for the study of a minimal hypersurface as a graph in a Euclidean space, especially for a translation hypersurface. Hence, in the following part, we use the basic characterization for the minimal graph’s Equation (3) in Proposition 1 to give a detailed proof of Theorem 3.
Let $M^n$ be a translation hypersurface immersed in $\mathbb{R}^{n+1}$ given by:

$$L(x_1, \ldots, x_n) = \left( x_1, \ldots, x_n, F(x_1, \ldots, x_n) \right),$$

with:

$$F(x_1, \ldots, x_n) = f_1(x_1) + \cdots + f_{n-1}(x_{n-1}) + f_n(u),$$

where $u = \sum_{i=1}^{n} c_i x_i$, $c_i$ are constants with $c_i \neq 0$, and each $f_i$ is a smooth function for $i = 1, \cdots, n - 1$. It is easy to check that:

$$F_i = f'_i + c_i f''_n, \quad F_n = c_n f''_n \tag{4}$$

$$F_{i\ell} = f''_i + c_i f''_{n\ell}, \quad F_{n\ell} = c^2_{n\ell} f''_n \tag{5}$$

$$F_{ij} = c_i c_j f''_n, \quad F_{i\ell n} = c_i c_{n\ell} f''_n \tag{6}$$

for $1 \leq i \leq n - 1$. Since $M^n$ is minimal, by Proposition 1, we substitute (4)–(6) into (3) and have:

$$\sum_{i=1}^{n-1} f''_i + \left( \sum_{i=1}^{n} c_i^2 + \sum_{i=1}^{n-1} f''_i \right) f'_n + c_n \left( \sum_{i=1}^{n-1} f''_i \right)^2 f''_n + \sum_{i\neq j}^{n-1} (c_i f'_j - c_j f'_i)^2 f''_n = 0. \tag{7}$$

Since $c_n \neq 0$, differentiating (7) with respect to $x_n$ gives:

$$\left[ \sum_{i=1}^{n} c_i^2 + c_n \sum_{i=1}^{n-1} f''_i + \frac{1}{2} \sum_{i\neq j}^{n-1} (c_i f'_j - c_j f'_i)^2 \right] f''_n''$$

$$+ 2 \left[ \sum_{i=1}^{n} \left( \sum_{j\neq i}^{n} c_j^2 \right) f''_i f''_n + \sum_{i\neq j}^{n-1} c_i f'_j f''_n f''_n = 0. \tag{8}$$

Based on (8), we divide into the following two cases for further discussions.

Case A. $f''_n = 0$. In this case, after suitable translation, there exists a constant $m$ such that $f_n = mu^2$. Hence, (8) becomes:

$$2m^2u \sum_{i=1}^{n-1} \left( \sum_{j \neq i}^{n} c_j^2 \right) f''_i + m \sum_{i\neq j}^{n-1} c_i f'_j f''_n = 0. \tag{9}$$

If $m = 0$, then $f_n = 0$, and the hypersurface reduces to a classical translation hypersurface studied before by Dillen et al. in [1]. Hence, according to Dillen et al.’s result, we get Theorem 3 immediately.

If $m \neq 0$, we will derive a contradiction. In fact, it follows from (9) that:

$$\sum_{i=1}^{n-1} \left( \sum_{j \neq i}^{n} c_j^2 \right) f''_i = 0, \quad \sum_{i\neq j}^{n-1} c_i f'_j f''_n = 0. \tag{10}$$

It follows from the first equation of (10) that each $f''_i$ is constant for $i = 1, \cdots, n - 1$. Then, there exist constants $a_i$ such that $f_i(x_i) = a_i x_i^2$. In this case, (10) becomes:

$$\sum_{i=1}^{n-1} \left( \sum_{j \neq i}^{n} c_j^2 \right) a_i = 0, \quad a_i c_i \sum_{j \neq i}^{n-1} a_j = 0, \quad \text{where } i = 1, \cdots, n - 1. \tag{11}$$
Substituting \( f_n = m u^2 \) and \( f_i = a_i x_i^2 \) for \( i = 1, \cdots, n - 1 \) into (7), we have:

\[
4m^2 \left[ \sum_{i=1}^{n-1} \left( \sum_{j \neq i}^n c_j^2 a_i \right) u^2 + 8m \left( \sum_{i=1}^{n-1} a_i c_i a_i x_i \right) u - 4m \sum_{i=1}^{n-1} a_i c_i c_i x_i x_j \right] + 4 \sum_{i=1}^{n-1} a_i^2 \left( m \sum_{j \neq i}^n c_j^2 + \sum_{j \neq i}^n a_j \right) x_i^2 + \sum_{i=1}^{n-1} a_i + m \sum_{i=1}^n c_i^2 = 0. \tag{12}
\]

Taking into account (11), (12) becomes:

\[
4m \sum_{i=1}^{n-1} a_i a_i c_i c_i x_i x_j = 4 \sum_{i=1}^{n-1} a_i^2 \left( m \sum_{j \neq i}^n c_j^2 + \sum_{j \neq i}^n a_j \right) x_i^2 + \sum_{i=1}^{n-1} a_i + m \sum_{i=1}^n c_i^2. \tag{13}
\]

Note that (13) is a quadratic polynomial with \( x_1, \cdots, x_{n-1} \). By the arbitrariness of \( x_i \), we have:

\[
a_i^2 \left( m \sum_{j \neq i}^n c_j^2 + \sum_{j \neq i}^n a_j \right) = 0 \tag{14}
\]

for every \( i = 1, \cdots, n - 1 \),

\[
\sum_{i=1}^{n-1} a_i + m \sum_{i=1}^n c_i^2 = 0, \tag{15}
\]

and:

\[
a_i a_j c_i c_j = 0 \tag{16}
\]

for every \( i, j = 1, \cdots, n - 1 \) and \( i \neq j \). It follows from (14) and (15) that:

\[
a_i^2 = -m(c_i a_i)^2 \tag{17}
\]

for every \( i = 1, \cdots, n - 1 \). From (16), we can see that at most one \( a_k c_k \) is not zero. Without loss of generality, we assume \( a_k c_k \neq 0 \) and all \( a_k c_k = 0 \) for \( k \neq k_0 \). From (17), we have \( a_{k_0} \neq 0 \) and \( a_k = 0 \) for \( k \neq k_0 \). This contradicts the first equation of (11). Thus, all \( a_k = 0 \) for \( k = 1, \cdots, n - 1 \) and \( f''_n(x_i) = 0 \). Then, (7) becomes:

\[
\left( \sum_{i=1}^n c_i^2 \right) 2m = 0,
\]

which is a contradiction.

**Case B.** \( f''_n \neq 0 \). Dividing by \( f''_n \) on both sides of (8), we have:

\[
\left[ \sum_{i=1}^n c_i^2 + c_i^2 \sum_{i=1}^{n-1} f_i'^2 + \frac{1}{2} \sum_{i \neq j}^{n-1} \left( c_i f_j' - c_j f_i' \right)^2 \right] + 2c_n \sum_{i=1}^{n-1} \left( \sum_{i \neq j} c_j^2 \right) f_i'' \frac{f''_n}{f''_n} + 2c_n \sum_{i \neq j} c_i f_i' f_j'' \frac{f''_n}{f''_n} = 0. \tag{18}
\]
Differentiating (18) with respect to $u$, we have:

$$
\left[ \sum_{i=1}^{n-1} \left( \sum_{j \neq i} c_j^2 \right) f''_i \right] \frac{f''_n}{f_n} + \sum_{i=1}^{n-1} c_i f'_i f''_n \frac{f''_n}{f_n} = 0.
$$

(19)

Next, we will give some claims.

**Claim 1.** $(\frac{f''_n}{f_n})_u \neq 0$.

In fact, if $(\frac{f''_n}{f_n})_u = 0$, there exist constants $a, b$ such that:

$$
f_n = af'_n + bu.
$$

(20)

The assumption $f''_n \neq 0$ implies that $a \neq 0$. Solving: (20) gives

$$
f_n(u) = ke^x + bu + ab,
$$

where $k$ is nonzero constant. In this case,

$$
\left( \frac{f''_n}{f_n} \right)_u = \frac{k}{a} e^x \neq 0.
$$

Then, from (19), we have:

$$
\sum_{i=1}^{n-1} \left( \sum_{j \neq i} c_j^2 \right) f''_i = 0.
$$

(21)

Therefore, all $f''_i$ are constants for $i = 1, \cdots, n-1$. Thus, there exist constants $a_i$ such that $f_i(x_i) = a_i x_i^2$, and (21) becomes:

$$
\sum_{i=1}^{n-1} \left( \sum_{j \neq i} c_j^2 \right) a_i = 0.
$$

In this case, (18) becomes:

$$
\sum_{i=1}^{n} c_i^2 + \sum_{i=1}^{n-1} \left(2a_i x_i^2\right) + \frac{1}{2} \sum_{i \neq j}^{n-1} \left(2c_i a_j x_j - 2c_j a_i x_i\right)^2 + 8ac_n \sum_{i \neq j}^{n-1} c_i a_i a_j x_i = 0,
$$

which is impossible.

**Claim 2.** $\sum_{i=1}^{n-1} \left( \sum_{j \neq i} c_j^2 \right) f''_i \neq 0$.

We assume $\sum_{i=1}^{n-1} \left( \sum_{j \neq i} c_j^2 \right) f''_i = 0$. Then, all $f''_i$ are constants for $i = 1, \cdots, n-1$. Hence, there exist constants $a_i$ such that $f_i(x_i) = a_i x_i^2$ and $\sum_{i=1}^{n-1} \left( \sum_{j \neq i} c_j^2 \right) a_i = 0$. It follows from (19) that $\sum_{i \neq j}^{n-1} c_i f'_i f''_j = 0$. Then, (18) becomes:

$$
\sum_{i=1}^{n} c_i^2 + \sum_{i=1}^{n-1} \left(2a_i x_i^2\right) + \frac{1}{2} \sum_{i \neq j}^{n-1} \left(2c_i a_j x_j - 2c_j a_i x_i\right)^2 = 0.
$$

This is a contradiction. Thus, we have $\sum_{i=1}^{n} \left( \sum_{j \neq i} c_j^2 \right) f''_i \neq 0$. 

According to Claim 1 and Claim 2, it follows from (19) that there exists a constant \( m \) such that:

\[
\sum_{i,j=1}^{n-1} c_i f_i' f_j'' = - \left( \frac{f_i'' f_j''}{f_i''} \right)_u = m. \tag{22}
\]

Hence,

\[
\left( \frac{f_i'' f_j''}{f_i''} \right)_u = - m \left( \frac{f_i''}{f_i''} \right)_u.
\]

By integration, there exists a constant \( c \) such that:

\[
f_i'' f_j'' = - m f_i'' + c,
\]

that is

\[
f_i'' = - m f_i'' + c f_i''.
\]

By integration, we get:

\[
f_i'' = 2m f_i'' = 2cf_i'' + c_0
\]

for some constant \( c_0 \). Moreover, solving the ODE (24), after a translation, gives:

\[
f_n = \begin{cases} 
-mu - 2c \ln \cos \left( \frac{\sqrt{-m^2 + c_0}}{2} u \right), & \text{if } m^2 + c_0 < 0; \\
-mu - 2c \ln \sinh \left( \frac{\sqrt{-m^2 + c_0}}{2} u \right) - 2c \ln 2, & \text{if } m^2 + c_0 > 0; \\
-mu - 2c \ln |u|, & \text{if } m^2 + c_0 = 0.
\end{cases}
\]

On the other hand, from (22), we have:

\[
\sum_{i,j=1}^{n-1} c_i f_i' f_j'' = m \sum_{i=1}^{n} \left( \sum_{i'=1}^{n} c_i f_i' \right) f_i''.
\]

Since \( \sum_{i=1}^{n} \left( \sum_{i'=1}^{n} c_i f_i' \right) f_i'' \neq 0 \) in Claim 2, it is impossible that all \( f_i'' \) are zeros for \( i = 1, \cdots, n - 1 \). We assume that \( f_i'' \neq 0 \). Then, differentiating (25) with respect to \( x_i \), we have:

\[
\left[ m \left( \sum_{i=1}^{n} c_i f_i' \right) - \sum_{i=1}^{n} \left( c_i f_i' \right) \right] \frac{f_i''}{f_i''} = c_i \sum_{i=1}^{n-1} f_i''. \tag{26}
\]

Now, we make another claim.

**Claim 3.** \( m \left( \sum_{i=1}^{n} c_i f_i' \right) - \sum_{i=1}^{n} \left( c_i f_i' \right) = 0. \)

Assume that \( m \left( \sum_{i=1}^{n} c_i f_i' \right) - \sum_{i=1}^{n} \left( c_i f_i' \right) \neq 0 \). We will get a contradiction again. It follows from (26) that there exists a constant \( a \) such that:

\[
\frac{f_i''}{c_i f_i''} = \frac{\sum_{i=1}^{n-1} f_i''}{m \left( \sum_{i=1}^{n} c_i f_i' \right) - \sum_{i=1}^{n} \left( c_i f_i' \right)} = a. \tag{27}
\]
By (27), there exist constants $b_i$ and $d_i$ such that:

$$f_{i0} = b_i e^{ac_{i0}x_{i0}} - \frac{d_i}{ac_{i0}} x_{i0}.$$  

(28)

From (27), we also have:

$$f''_i + ac_i f'_i = am \sum_{i=1}^{n} c_i^2$$

for every $i = 1, \cdots, i_0 - 1, i_0 + 1, \cdots, n - 1$. Solving this equation, we have:

$$f_i = b_i e^{-ac_i x_i} + \frac{m(\sum_{i=1}^{n-1} c_i^2)}{c_i} x_i,$$  

(29)

where $b_i$ are constants for $i = 1, \cdots, i_0 - 1, i_0 + 1, \cdots, n - 1$. On the other hand, differentiating (25) with respect to $x_k$ for $k = 1, \cdots, i_0 - 1, i_0 + 1, \cdots, n - 1$, we have:

$$f''_k [\sum_{i=k}^{n-1} c_i f'_i - m \sum_{i=k}^{n} c_i^2] + c_k f''_k \sum_{i=k}^{n-1} f''_i = 0.$$  

(30)

Substituting (28) and (29) into (30), we have:

$$2ac_k b_k \sum_{i=k+1}^{n-1} c_i^2 b_i e^{-a(c_i x_i + c_k x_k)} = \sum_{i=k}^{n} c_k b_i B_k e^{-ac_k x_k}.$$  

(31)

for $k = 1, \cdots, i_0 - 1, i_0 + 1, \cdots, n - 1$, where:

$$B_k = (n - 3)m \sum_{i=1}^{n} c_i^2 - m \sum_{i=1}^{n} c_i^2 - \frac{d_{i0}}{a}.$$  

From (31) and the arbitrariness of $x_k$, we have $c_k^2 b_k c_i^2 b_i = 0$, which is equivalent to $c_k b_k c_i b_i = 0$ for $i, k = 1, \cdots, i_0 - 1, i_0 + 1, \cdots, n - 1$ and $i \neq k$. It follows that at most one $c_k b_k$ is not zero. We assume that all $c_k b_k = 0$ for $k = 1, \cdots, i_0 - 1, i_0 + 1, \cdots, n - 1$ and $k \neq j_0$. In this case:

$$f'_{j0} = -ab_{j0} c_{j0} e^{-ac_{j0} x_{j0}} + \frac{m \sum_{i=1}^{n} c_i^2}{c_{j0}},$$  

(32)

and:

$$f'_{k} = \frac{m \sum_{i=1}^{n} c_i^2}{c_k}.$$  

(33)

for $k = 1, \cdots, i_0 - 1, i_0 + 1, \cdots, n - 1$ and $k \neq j_0$. Substituting (28), (32), and (33) into (25), we have:

$$(n - 3)m(\sum_{i=1}^{n} c_i^2) a^2 b_{j0} c_{j0} e^{-ac_{j0} x_{j0}} + a^2 b_{j0} c_{j0} e^{-ac_{j0} x_{j0}} = 0.$$
where:
\[ C = (n - 3)m \sum_{i=1}^{n} c_i^2 - m \sum_{i=1}^{n} c_i^2 - \frac{d_{i0}}{a}, \]

It follows that \( n = 3 \), and (18) becomes:
\[ \left[ \sum_{i=1}^{3} c_i^2 + c_3^2 \sum_{i=1}^{2} f_i'^2 + (c_1 f_2' - c_2 f_1')^2 \right] 
+ 2c_3 \left[ \sum_{i=1}^{n} \left( \sum_{j=1}^{n} c_j f_i' f_j' \right) \frac{f_i' f_j'}{f_m'} + 2c_3 \sum_{i=1}^{n} c_i f_i' f_i'' \frac{f_i''}{f_m'} = 0. \] (34)

From (23) and (25), (34) becomes:
\[ c_1^2 + c_2^2 + c_3^2 + c_3^2 (f_1'^2 + f_2'^2) + (c_1 f_2' - c_2 f_1')^2 + 2c_3(c_3^2 + c_2^2) f_i' + (c_3^2 + c_1^2) f_i'' = 0. \] (35)

Differentiating (35) with respect to \( x_1 \), we have:
\[ c_3^2 f_i' f_i'' - c_2 (c_1 f_2' - c_2 f_1') f_i'' + c_3 (c_3^2 + c_2^2) f_i'' = 0. \]

Rewriting (36), we have:
\[ (c_3^2 + c_2^2) (f_i' + c_3 f_i'' \frac{f_i''}{f_m'}) = c_1 c_2 f_i'. \] (36)

Therefore, \( f_2' \) is constant, and \( f_i'' = 0 \), which is a contradiction. We complete the proof of Claim 3.

Now, we have proven that \( m(\sum_{i=1}^{n} c_i^2) - \sum_{i=1}^{n-1} (c_i f_i') = 0 \), and \( f_i' \) are constants for \( i = 1, \ldots, i_0 - 1, i_0 + 1, \ldots, n - 1 \). There exist constants \( a_i \) such that \( f_i'(x_i) = a_i \), and:
\[ m(\sum_{i=1}^{n} c_i^2) = \sum_{i=1}^{n-1} (c_i a_i). \] (37)

Then, (18) becomes:
\[ \sum_{i=1}^{n} c_i^2 + c_2^2 \sum_{i=1}^{n-1} a_i^2 + f_{i0} \sum_{i=1}^{n} c_i^2 + (a_i^2) \sum_{i=1}^{n} c_i^2 
- 2c_i f_{i0}^n \sum_{i=1}^{n-1} c_i a_i - \sum_{i=1}^{n-1} c_i a_i \sum_{i=1}^{n} c_i a_i 
+ 2c_i f_{i0}^n \sum_{i=1}^{n} c_i a_i f_i'' \frac{f_i''}{f_m'} + 2c_i f_{i0}^n \sum_{i=1}^{n-1} c_i a_i f_i'' \frac{f_i''}{f_m'} = 0. \] (38)
From (23) and (37), (38) becomes:

\[
\sum_{i=1}^{n} c_i^2 + \sum_{i=1}^{n} d_i^2 + f_{l_0}^{f_0} \sum_{i=1}^{n} c_i^2 + \sum_{i=1}^{n} (a_i^2 \sum_{j=1, j \neq i}^{n-1} c_j^2) - 2c_{l_0}f'_{l_0} \sum_{i=1}^{n} c_i a_i - \sum_{i=1}^{n-1} (c_i a_j \sum_{j=1, j \neq i}^{n-1} c_i a_j) + 2cc_n f''_{l_0} (\sum_{i=1}^{n} c_i^2) = 0.
\]

(39)

Rewriting (39), we have:

\[
\left( \sum_{i=1}^{n} c_i^2 \right) f_{l_0}^{f_0^2} - 2c_{l_0} \left( \sum_{i=1}^{n} c_i a_i \right) f'_{l_0} + 2cc_n \left( \sum_{i=1}^{n} c_i^2 \right) f''_{l_0} + B = 0,
\]

where:

\[
B = \sum_{i=1}^{n} c_i^2 + \sum_{i=1}^{n} d_i^2 + \sum_{i=1}^{n} (a_i^2 \sum_{j=1, j \neq i}^{n-1} c_j^2) - \sum_{i=1}^{n-1} (c_i a_j \sum_{j=1, j \neq i}^{n-1} c_i a_j) = \sum_{i=1}^{n} c_i^2 + (c_n^2 + c_{l_0}^2) \sum_{i=1}^{n} a_i^2 + \frac{1}{2} \sum_{i=1}^{n} \sum_{j=1, j \neq i}^{n-1} (a_i c_j - a_j c_i)^2 > 0.
\]

By (37), (40) becomes:

\[
f_{l_0}^{f_0^2} - 2mc_{l_0} f'_{l_0} + 2cc_n f''_{l_0} + \frac{B}{\sum_{i=1}^{n} c_i^2} = 0.
\]

Solving this equation, we have:

\[
f_{l_0} = 2cc_n \ln \cos \frac{A}{2cc_n} x_{l_0} + mc_{l_0} x_{l_0},
\]

(41)

where:

\[
A = \sqrt{\frac{B}{\sum_{i=1}^{n} c_i^2}} - m2c_{l_0}^2.
\]

On the other hand, since \( f'_i(x_i) = a_i \) for \( i = 1, \ldots, i_0 - 1, i_0 + 1, \ldots, n - 1 \), (7) becomes:

\[
\left[ \sum_{i=1}^{n} c_i^2 + \sum_{i=1}^{n} d_i^2 + \sum_{i=1}^{n} c_i^2 + \sum_{i=1}^{n} (a_i^2 \sum_{j=1, j \neq i}^{n-1} c_j^2) - 2c_{l_0}f'_{l_0} \sum_{i=1}^{n} c_i a_i - \sum_{i=1}^{n-1} (c_i a_j \sum_{j=1, j \neq i}^{n-1} c_i a_j) \right] f''_{l_0}
\]

\[
+ \left[ 1 + \sum_{i=1}^{n} a_i^2 + \left( \sum_{i=1}^{n} c_i^2 \right) f_{l_0}^{f_0^2} + 2 \left( \sum_{i=1}^{n} c_i a_i \right) f'_{l_0} \right] f''_{l_0} = 0.
\]

(42)
Combining (42) with (39), we have:

\[
\left[ 1 - 2cc_n \left( \sum_{i=0}^{n} c_i^2 \right) f'' + \sum_{i=0}^{n-1} a_i^2 + \left( \sum_{i=0}^{n} c_i^2 \right) f'^2 + 2 \left( \sum_{i=0}^{n-1} c_i a_i \right) f' f'' \right] f'' = 0. \tag{43}
\]

Since \( f'' \neq 0 \), from (37) and (43), we have:

\[
f''^2 + 2mf' = 2cc_nf'' - \frac{1 + \sum_{i=0}^{n-1} a_i^2}{\sum_{i=0}^{n-1} c_i^2},
\]

which together with (24) forces that:

\[ c_0 = \frac{1 + \sum_{i=0}^{n-1} a_i^2}{\sum_{i=0}^{n-1} c_i^2}. \]

From (37), we have:

\[
m^2 + c_0 = \frac{-\sum_{i=0}^{n} c_i^2 - c_n^2 \sum_{i=0}^{n-1} a_i^2 - \left( \sum_{i=0}^{n-1} a_i^2 \sum_{i=0}^{n} c_i^2 - \left( \sum_{i=0}^{n-1} c_i a_i \right)^2 \right)}{\left( \sum_{i=0}^{n-1} c_i^2 \right)^2} < 0.
\]

This is a contradiction, and hence, the second and third expressions of \( f_n \) in (41) are impossible. After some translation, we have \( f_i = 0 \) for \( i = 1, \cdots, n-1, i_0 + 1, \cdots, n \) and:

\[
f_{i_0} = 2cc_n \ln \cos \frac{x_{i_0}}{2cc_n} \sqrt{\frac{\sum_{i=0}^{n} c_i^2}{\sum_{i=0}^{n-1} c_i^2}}, \quad f_n = -2cc_n \ln \cos \frac{\mu}{2cc_n} \sqrt{\frac{1}{\sum_{i=0}^{n-1} c_i^2}}.
\]

Thus, the hypersurface is given by:

\[
F(x_1, \cdots, x_n) = 2cc_n \ln \frac{\cos \frac{x_{i_0}}{2cc_n} \sqrt{\frac{\sum_{i=0}^{n} c_i^2}{\sum_{i=0}^{n-1} c_i^2}}}{\cos \frac{1}{2cc_n} \sqrt{\frac{1}{\sum_{i=0}^{n-1} c_i^2}}(c_1 x_1 + \cdots + c_n x_n)}.
\]

At this moment, we complete the proof of Theorem 3.

**Author Contributions:** D.Y. and J.Z. contributed analysis tools and the computation; Y.F. wrote the paper.
