Table S-1. Optimization of conditions for the two-step procedure to produce 1-aryl-5-nitro-1H-indazoles.

The optimum conditions for hydrazone formation involved the use of 3.0 mmol of ArNHNH$_2$·HCl with the ketone substrate, 2.0 mmol with the aldehyde substrate. Ring closure was best effected through the use of 3.0 mmol of K$_2$CO$_3$ at 90 °C.
Table S-2. Optimization of conditions for the one-pot procedure to produce 1-aryl-5-nitro-1\textit{H}-indazoles.

![Chemical structures](image)

The one-step procedure to make 5-nitro-1-aryl-1\textit{H}-indazoles was successful for the acetophenone substrate 1. Benzaldehyde 2 gave higher yields when the reagents were added sequentially to first produce the hydrazone, followed by ring closure with base. The optimum conditions used 30 wt\% of 4Å molecular sieves (to scavenge water) and DMPU as the solvent at 90 °C.

ᵃAll reagents were added and then gradually heated to 90-100 °C; ᵇSubstrate 14, PhNHNH₂·HCl and 30 wt% of powdered 4Å molecular sieves were added and immersed into a pre-heated oil bath at 90 °C, stirred for 1.5 h, and then 20 mol% CuI and base were added. ᶜTetramethylguanidine.

Optimum conditions for the general synthesis of 1-aryl-1H-indazoles involved mixing 1.5 equiv of the ArNHNH₂·HCl, 2.5 equiv of K₂CO₃ and 30 wt% of powdered 4Å molecular sieves in 5 mL of DMPU and heating at 90 °C (pre-heated oil bath). After 1.5 h, 20 mol% of CuI and 2.5 equiv of K₂CO₃ were added and heating was resumed at 90 °C for ca 16 h. Filtration, aqueous work-up and silica gel chromatography afforded the final product in pure form.
