Figure S1. Survival of vaccinated mice following single *S. pneumoniae* infection. Mice were i.m. vaccinated with either PBS, PspA, or Prevnar and boosted on day 21 (n = ~6/group). Two weeks post-vaccination mice were i.n. infected with either 1×10^6, 5×10^4, 5×10^3, 5×10^2 CFU of *S. pneumoniae* serotype 3 A66.1 and survival was monitored for 12 days. *p < 0.05, **p < 0.01 as determined by Log-rank (Mantel-Cox) test.
