Supplementary Material: Deterministic Models of Growth and Mortality for Jack Pine in Boreal Forests of Western Canada

Vlad C. Strimbu 1*, Mike Bokalo 1 and Philip G. Comeau 1

Figure S1: Observed vs predicted for the independent validation data (n=34) using MGM stand predictions with respective validation metrics: average mean bias (AMB), relative mean bias (RMB) and efficiency (EF). The shown variables are: average DBH, average height, top height, density, stand basal area and stand volume for coniferous and deciduous component, respectively.
