Supplementary Information

**Figure S1.** The cell viability of two gastric cancer cell lines, SNU-1 and NCI-N87 cells, were suppressed in a dose-dependently manner upon treatment with 13-AC. The SNU-1 and NCI-N87 cells were treated without or with the 13-AC at the final concentration between 2.5 μM and 20 μM for 24h. The cells were then harvested for the MTT assay as described in the Materials and Methods. Data shown here is representative of three independent experimental results.
