Abstract: In this paper, we present a systematic and unified investigation for the Apostol-Bernoulli polynomials, the Apostol-Euler polynomials and the Apostol-Genocchi polynomials. By applying the generating-function methods and summation-transform techniques, we establish some higher-order convolutions for the Apostol-Bernoulli polynomials, the Apostol-Euler polynomials and the Apostol-Genocchi polynomials. Some results presented here are the corresponding extensions of several known formulas.

Keywords: Apostol-Bernoulli polynomials; Apostol-Euler polynomials; Apostol-Genocchi polynomials; convolution identities; stirling numbers of the first and second kind

1. Introduction

Throughout this paper, \( \mathbb{C} \) and \( \mathbb{C}^\times \) denote the set of complex numbers and the set of complex numbers excluding zero, respectively. We also denote by \( \mathbb{N} \) and \( \mathbb{N}^+ \) the set of positive integers and the set of non-negative integers, respectively. For \( \alpha, \lambda \in \mathbb{C} \), the generalized Apostol-Bernoulli polynomials \( B_n^{(\alpha)}(x; \lambda) \), the generalized Apostol-Euler polynomials \( E_n^{(\alpha)}(x; \lambda) \) and the generalized Apostol-Genocchi polynomials \( G_n^{(\alpha)}(x; \lambda) \) of order \( \alpha \) are defined by the following generating functions (see, e.g., [1–4]):

\[
\left( \frac{t}{\lambda e^t - 1} \right)^{\alpha} e^{xt} = \sum_{n=0}^{\infty} B_n^{(\alpha)}(x; \lambda) \frac{t^n}{n!}
\]

(1)

(\(|t| < 2\pi \) when \( \lambda = 1 \); \(|t| < |\log \lambda| \) when \( \lambda \neq 1; 1^{\alpha} := 1 \)),

\[
\left( \frac{2}{\lambda e^t + 1} \right)^{\alpha} e^{xt} = \sum_{n=0}^{\infty} E_n^{(\alpha)}(x; \lambda) \frac{t^n}{n!}
\]

(2)

(\(|t| < \pi \) when \( \lambda = 1 \); \(|t| < |\log(-\lambda)| \) when \( \lambda \neq 1; 1^{\alpha} := 1 \))

and

\[
\left( \frac{2t}{\lambda e^t + 1} \right)^{\alpha} e^{xt} = \sum_{n=0}^{\infty} G_n^{(\alpha)}(x; \lambda) \frac{t^n}{n!}
\]

(3)

(\(|t| < \pi \) when \( \lambda = 1 \); \(|t| < |\log(-\lambda)| \) when \( \lambda \neq 1; 1^{\alpha} := 1 \)).

In particular, the polynomials $B_n(x; \lambda)$, $E_n(x; \lambda)$ and $G_n(x; \lambda)$ given by

$$B_n(x; \lambda) = B_n^{(1)}(x; \lambda), \quad E_n(x; \lambda) = E_n^{(1)}(x; \lambda)$$

and

$$G_n(x; \lambda) = G_n^{(1)}(x; \lambda)$$

are called the Apostol-Bernoulli polynomials, the Apostol-Euler polynomials and the Apostol-Genocchi polynomials, respectively. The Apostol-Bernoulli numbers $B_n(\lambda)$, the Apostol-Euler numbers $E_n(\lambda)$ and the Apostol-Genocchi numbers $G_n(\lambda)$ are expressed by means of the Apostol-Bernoulli polynomials, the Apostol-Euler polynomials and the Apostol-Genocchi polynomials, as follows:

$$B_n(\lambda) = B_n(0; \lambda), \quad E_n(\lambda) = 2^n E_n \left( \frac{1}{2}; \lambda \right) \quad \text{and} \quad G_n(\lambda) = G_n(0; \lambda). \quad (4)$$

Furthermore, the case $\alpha = \lambda = 1$ in (1), (2) and (3) gives the Bernoulli polynomials $B_n(x)$, the Euler polynomials $E_n(x)$ and the Genocchi polynomials $G_n(x)$, that is,

$$B_n(x) = B_n^{(1)}(x; 1), \quad E_n(x) = E_n^{(1)}(x; 1) \quad \text{and} \quad G_n(x) = G_n^{(1)}(x; 1).$$

Also the case $\lambda = 1$ in (4) gives the Bernoulli numbers $B_n$, the Euler numbers $E_n$ and the Genocchi numbers $G_n$ as follows:

$$B_n = B_n(0), \quad E_n = 2^n E_n \left( \frac{1}{2} \right) \quad \text{and} \quad G_n = G_n(0).$$

Recently, the above-defined generalized Apostol-Bernoulli polynomials, the generalized Apostol-Euler polynomials and the generalized Apostol-Genocchi polynomials was unified by the following generating function (see, for example, [5]):

$$\left( \frac{2^{1-x} r^x}{b^x - a^x} \right)^{\alpha} e^{xt} = \sum_{n=0}^{\infty} \mathcal{Y}_{n, \alpha}(x; \kappa, \alpha, \beta) \frac{t^n}{n!} \quad (5)$$

$$\left( |t| < 2\pi \quad \text{when} \quad \beta = a; \quad |t| < \log \left( \frac{\beta}{a} \right) \quad \text{when} \quad \beta \neq a; \quad \kappa, \alpha, \beta \in \mathbb{C}; \quad a, b \in \mathbb{C}^\times; \quad 1^a := 1 \right).$$

It is worth mentioning that the case $\alpha = 1$ in (5) was constructed by Ozden et al. [6,7]. It is easily seen that the polynomials $\mathcal{Y}_{n, \alpha}(x; \kappa, \alpha, \beta)$ given by

$$\mathcal{Y}_{n, \alpha}(x; \kappa, \alpha, \beta) = \mathcal{Y}_{n, \alpha}^{(1)}(x; \kappa, \alpha, \beta) \quad (6)$$

can be regarded as a generalization and unification of the Apostol-Bernoulli polynomials, the Apostol-Euler polynomials and the Apostol-Genocchi polynomials with, of course, suitable choices of the parameter $a$, $b$ and $\beta$. We refer to the recent works [8–13] on these Apostol-type polynomials and numbers.

In the present paper, we shall be concerned with some higher-order convolutions for the Apostol-Bernoulli polynomials, the Apostol-Euler polynomials and the Apostol-Genocchi polynomials. The idea stems from the higher-order convolutions for the Bernoulli polynomials due to Agoh and Dilcher [14], Bayad and Kim [15] and Bayad and Komatsu [16]. We establish several
higher-order convolutions for the Apostol-Bernoulli polynomials, the Apostol-Euler polynomials
and the Apostol-Genocchi polynomials by making use of the generating-function methods and
summation-transform techniques. It turns out that several interesting known results are obtainable as
special cases of our main results.

This paper is organized as follows. In Section 2, we first give the higher-order convolution
for the polynomials defined by (5) \( Y_{n,\beta}(x; \kappa, a, b) \) and then present the corresponding higher-order
convolutions for the Apostol-Bernoulli polynomials, the Apostol-Euler polynomials and the
Apostol-Genocchi polynomials. Moreover, several corollaries and consequences of our main
theorems are also deduced. Section 3 is devoted to the proofs of the main results by applying the
generating-function methods and summation-transform techniques.

2. Main Results

As usual, by \( (\lambda)^n \) we denote the binomial coefficients given, for \( \lambda \in \mathbb{C} \), by
\[
(\lambda)^n = 1 \quad \text{and} \quad (\lambda^\frac{1}{n}) = \frac{\lambda(\lambda-1) \cdots (\lambda-n+1)}{n!} \quad (n \in \mathbb{N}).
\]

The multinomial coefficient
\[
\binom{n}{r_1, \cdots, r_k}
\]
is given, for \( n, r_1, \cdots, r_k \in \mathbb{N}^* \) \( (k \in \mathbb{N}) \), by
\[
\binom{n}{r_1, \cdots, r_k} = \frac{n!}{r_1! \cdots r_k!} \quad (k \in \mathbb{N}).
\]

We also denote by \( s(n, k) \) the Stirling numbers of the first kind and by \( S(n, k) \) the Stirling
numbers of the second kind, which are usually defined by the following generating functions (see,
for example, [17,18]):
\[
\left[ \ln(1+t)^k \right] = \sum_{n=k}^{\infty} s(n, k) \frac{t^n}{n!} \quad \text{and} \quad \left[ \frac{e^t-1}{t} \right] = \sum_{n=k}^{\infty} S(n, k) \frac{t^n}{n!}.
\]

For \( k \in \mathbb{N} \) and \( i_1, \cdots, i_k, n \in \mathbb{N}^* \), we write
\[
\left[ f_{i_1}(x_1) + \cdots + f_{i_k}(x_k) \right]^n = \sum_{l_1+\cdots+l_k=n} \binom{n}{l_1, \cdots, l_k} f_{i_1+l_1}(x_1) \cdots f_{i_k+l_k}(x_k).
\]

where \( f_j(x_j) (1 \leq j \leq k) \) is a sequence of polynomials. The case when \( f_{i}(x) = B_{i}(x) \) in (7) was first
studied by Agoh and Dilcher [14] who proved an existence theorem and also derived some explicit
expressions for \( k = 3 \) involving the Bernoulli polynomials. We now state the following higher-order
convolution for the general Apostol-type polynomials \( Y_{n,\beta}(x; \kappa, a, b) \) defined by (5).

**Theorem 1.** Let \( d \) be a positive integer and let
\[
y = x_1 + \cdots + x_d.
\]

Then, for an integer \( \kappa \) and for \( m, n \in \mathbb{N}^* \),
\[ \sum_{i_1 + \cdots + i_d = m \atop (i_1, \ldots, i_d \geq 0)} \binom{m}{i_1, \ldots, i_d} \left[ \mathcal{V}_{i_1, \beta}(x_1; \kappa, a, b) + \cdots + \mathcal{V}_{i_d, \beta}(x_d; \kappa, a, b) \right]^n = \left( \frac{2^{1-k}}{\alpha^{d-1}} \right) (m+n)! \sum_{j=0}^{d-1} s(d, i) \frac{i!}{i^j j!} \binom{i}{j} (\kappa + j - 1) \]

Thus, by applying (8) to Theorem 1, we get the following higher-order convolution for the Apostol-Euler polynomials.

**Corollary 1.** Let \( d \) be a positive integer and let

\[ y = x_1 + \cdots + x_d. \]

Then, for \( m, n \in \mathbb{N}^* \),

\[ \sum_{i_1 + \cdots + i_d = m \atop (i_1, \ldots, i_d \geq 0)} \binom{m}{i_1, \ldots, i_d} \left[ \mathcal{E}_{i_1}(x_1; \lambda) + \cdots + \mathcal{E}_{i_d}(x_d; \lambda) \right]^n = \left( \frac{2^{d-1}}{(d-1)!} \right) \sum_{j=0}^{d-1} s(d, i) \frac{i!}{i^j j!} \binom{i}{j} (\lambda - 1)^j y^{d-1} \mathcal{E}_{n+j+l}(y; \lambda). \]

Obviously, in the case when \( m = 0 \), Corollary 1 yields the following further special case for \( d \in \mathbb{N} \) and \( n \in \mathbb{N}^* \):

\[ \left[ \mathcal{E}_0(x_1; \lambda) + \cdots + \mathcal{E}_0(x_d; \lambda) \right]^n = \left( \frac{2^{d-1}}{(d-1)!} \right) \sum_{j=0}^{d-1} s(d, i) \frac{i!}{i^j j!} \binom{i}{j} (\lambda - 1)^j y^{d-1} \mathcal{E}_{n+j}(y; \lambda), \]

which, upon setting \( i \mapsto i + 1 \), corresponds to the following result for the Apostol-Euler polynomials due to Bayad and Kim [15] Theorem 4:

\[ \sum_{i_1 + \cdots + i_d = n \atop (i_1, \ldots, i_d \geq 0)} \binom{n}{i_1, \ldots, i_d} \mathcal{E}_{i_1}(x_1; \lambda) \cdots \mathcal{E}_{i_d}(x_d; \lambda) = \left( \frac{2^{d-1}}{(d-1)!} \right) \sum_{j=0}^{d-1} s(d, i) \frac{i!}{i^j j!} \binom{i}{j} (-y)^j \mathcal{E}_{n+j-i}(y; \lambda). \]

If we change the order of the summation on the right-hand side of (9), we get
Theorem 2. Let $d \in \mathbb{N}$ and let
\[ y = x_1 + \cdots + x_d. \]
Then, for $m, n \in \mathbb{N}^*$ ($m + n \geq d$),
\[
\sum_{i_1 + \cdots + i_d = m \atop (i_1, \ldots, i_d \geq 0)} \binom{m}{i_1, \ldots, i_d} \left[ B_{i_1}(x_1; \lambda) + \cdots + B_{i_d}(x_d; \lambda) \right]^n \\
= \frac{(m + n)!}{(m + n - d)! \cdot (d - 1)!} \sum_{i=1}^{d} s(d, i) \sum_{j=0}^{i-1} \binom{i-1}{j} \binom{-1}{m + n + j + 1 - d} B_{m + n + j + 1 - d}(y; \lambda).
\]

For $\lambda = 1$, Theorem 2 reduces to the following higher-order convolution for the Bernoulli polynomials:
\[
\sum_{i_1 + \cdots + i_d = m \atop (i_1, \ldots, i_d \geq 0)} \binom{m}{i_1, \ldots, i_d} \left[ B_{i_1}(x_1) + \cdots + B_{i_d}(x_d) \right]^n \\
= \frac{(m + n)!}{(m + n - d)! \cdot (d - 1)!} \sum_{i=1}^{d} s(d, i) \sum_{j=0}^{i-1} \binom{i-1}{j} \binom{-1}{m + n + j + 1 - d} B_{m + n + j + 1 - d}(y; \lambda)
\]
\[ (y = x_1 + \cdots + x_d; \ d \in \mathbb{N}; \ m, n \in \mathbb{N}^*; \ m + n \geq d). \]

For a different expression than that given by (12) in its special case when
\[ x_1 = \cdots = x_d = x, \]
see a known result [16] Corollary 4.
If we set \( m = 0 \) in Theorem 2, we get

\[
[B_0(x_1; \lambda) + \cdots + B_0(x_d; \lambda)]^n = \frac{n!}{(n-d)! \cdot (d-1)!} \sum_{j=1}^d (-1)^{i-1} s(d, i) \sum_{i=0}^{i-1} \binom{i-1}{j} \left( \frac{(-y)^{i-1-j}}{n+j+1-d} B_{n+j+1-d}(y; \lambda) \right)\]

(13)

\( (y = x_1 + \cdots + x_d; n, d \in \mathbb{N}; n \geq d) \).

For \( r \in \mathbb{N} \) and \( m, n \in \mathbb{N}^* \), it is known that (see, for example, [20] Theorem 1.2)

\[
\sum_{k=0}^{m} \binom{m}{k} x^{m-k} f_{n-k}(y) - \sum_{k=0}^{n} \binom{n}{k} (-x)^{n-k} f_{n-k}(x+y) = (-1)^n n^{m(n+m+1)} \int_0^1 t^n (1-t)^n f_{r-1}(x+y) \, dt,
\]

(14)

where \( \langle \lambda \rangle_n \) denotes the rising factorial of order \( n \) given by

\[
\langle \lambda \rangle_0 = 1 \quad \text{and} \quad \langle \lambda \rangle_n = \lambda(\lambda+1) \cdots (\lambda+n-1) \quad (n \in \mathbb{N}; \lambda \in \mathbb{C}),
\]

and \( \{f_n(x)\}_{n=0}^\infty \) is a sequence of polynomials generated by

\[
\sum_{n=0}^\infty f_n(x) \frac{t^n}{n!} = F(t)e^{(x-\frac{1}{2})t},
\]

(15)

with \( F(t) \) being a formal power series. Thus, by taking

\[
F(t) = \frac{te^t}{\lambda e^t - 1}
\]

in (15) and substituting \( n - d \) for \( m, i - 1 \) for \( n, y \) for \( x \) and 0 for \( y \) in (14), we find (for positive integers \( i, d, n \) with \( n \geq d \) that

\[
\sum_{j=0}^{n-d} \binom{n-d}{j} y^{n-d-j} B_{i+j}(\lambda) - \sum_{j=0}^{i-1} \binom{i-1}{j} (-y)^{i-1-j} \frac{B_{i+j+1-d}(y; \lambda)}{n+j+1-d} = (-1)^i y^{n-d+i} \int_0^1 t^n (1-t)^{i-1} B_0(y-yt) \, dt.
\]

(16)

It is easily seen from the properties of the Beta function \( B(a, b) \) and the Gamma function \( \Gamma(z) \) that

\[
B(m+1, n+1) = \int_0^1 t^m (1-t)^n \, dt = \frac{\Gamma(m+1)\Gamma(n+1)}{\Gamma(m+n+2)} = \frac{m! \cdot n!}{(m+n+1)!} \quad (m, n \in \mathbb{N}^*).
\]

Let \( \delta_{1, \lambda} \) be a Kronecker symbol given by

\[
\delta_{1, \lambda} = \begin{cases} 1 & (\lambda = 1) \\ 0 & (\lambda \neq 1). \end{cases}
\]

Since \( B_0(x; \lambda) = 1 \) when \( \lambda = 1 \) and \( B_0(x; \lambda) = 0 \) when \( \lambda \neq 1 \) (see, for example, [3]), by setting

\[
B_0(x; \lambda) = \delta_{1, \lambda}
\]

in (16), with the help of (17), we have

\[
\sum_{j=0}^{i-1} \binom{i-1}{j} (-y)^{i-1-j} \frac{B_{i+j+1-d}(y; \lambda)}{n+j+1-d} = \sum_{j=0}^{n-d} \binom{n-d}{j} y^{n-d-j} \frac{B_{i+j}(\lambda)}{i+j} - (-1)^i y^{n-d+i} \delta_{1, \lambda} \frac{(n-d)! \cdot (i-1)!}{(n-d+i)!}.
\]

(18)
We find from (13) and (18) the following formula due to Bayad and Kim [15] Theorem 5 for sums of products of the Apostol-Bernoulli polynomials:

\[
\sum_{i_1 + \cdots + i_d = n} \binom{n}{i_1, \ldots, i_d} B_{i_1}(x_1; \lambda) \cdots B_{i_d}(x_d; \lambda) \\
= \frac{n!}{(d-1)!} \sum_{i=1}^{d} (-1)^{i} s(d, i) \left( \sum_{j=0}^{n-d} \frac{B_{n-j}(\lambda)}{j!(n-d-j)!} \right) y^{n-d-j} \\
+ \delta_{1, \lambda} \frac{1}{(d-1)!} \sum_{i=1}^{d} s(d, i) \left( \sum_{j=0}^{n-d} \frac{B_{n-j}(\lambda)}{j!(n-d-j)!} \right) y^{n-d-i} \tag{19}
\]

\((y = x_1 + \cdots + x_d; \ n, d \in \mathbb{N}; \ n \geq d).\)

Upon changing the order of the summation on the right-hand side of (13), we get

\[
[B_0(x_1; \lambda) + \cdots + B_0(x_d; \lambda)]^n \\
= \frac{n!}{(n-d)!} (d-1)! \sum_{j=0}^{d-1} (-1)^j \left( \sum_{i=0}^{n-d-j} \frac{B_{n-j-i}(\lambda)}{i!(n-d-j-i)!} \right) y^{i-d-j} \tag{20}
\]

which, in the special case when \(\lambda = 1\), yields the following famous formula for the Bernoulli polynomials due to Dilcher [19] Theorem 3:

\[
\sum_{i_1 + \cdots + i_d = n} \binom{n}{i_1, \ldots, i_d} B_{i_1}(x_1) \cdots B_{i_d}(x_d) \\
= (-1)^{d-1} \frac{n!}{d!} \sum_{j=0}^{d-1} (-1)^j \left( \sum_{i=0}^{j} \binom{d+i-j-1}{i} s(d+i-j) y^i \right) \frac{B_{n-j}(y)}{n-j} \tag{21}
\]

\((y = x_1 + \cdots + x_d; \ n, d \in \mathbb{N}; \ n \geq d).\)

Let \(p_{n,m}(x)\) denote a polynomial given by (see, for example [21,22])

\[
p_{n,m}(x) = \frac{(-1)^{n-m-1} n^{-1}}{(n-1)!} \sum_{k=m}^{n} \binom{k}{m} s(n, k+1) x^{k-m}. \tag{22}
\]

Then, by applying (20) and (22), we get

\[
\sum_{i_1 + \cdots + i_d = n} \binom{n}{i_1, \ldots, i_d} B_{i_1}(x_1; \lambda) \cdots B_{i_d}(x_d; \lambda) \\
= (-1)^{d-1} \frac{n!}{(n-d)!} \sum_{j=0}^{d-1} p_{d,j-1}(y) \frac{B_{n-j}(y; \lambda)}{n-j} \tag{23}
\]

\((y = x_1 + \cdots + x_d; \ n, d \in \mathbb{N}; \ n \geq d),\)

which is a generalization of the following result given by Kim and Hu [22] Theorem 1.2 for the Apostol-Bernoulli numbers:
Let $d \in \mathbb{N}$ and let
\[ y = x_1 + \cdots + x_d. \]

Then, for $m, n \in \mathbb{N}^*$ ($m \geq n$),
\[
\sum_{i_1 + \cdots + i_d = m \atop (i_1, \ldots, i_d \geq 0)} \left( \begin{array}{c} m \\ i_1, \ldots, i_d \end{array} \right) G_{i_1}(x_1; \lambda) \cdots G_{i_d}(x_d; \lambda) = \left( \frac{(-1)^{n+d+1} n! (d-1)!}{n-d!} \sum_{j=0}^{d-1} p_{d,d-j}(d) \frac{B_{d-j}(\frac{1}{n})}{n} \right) \quad (n > d)
\]
\[
= n! \cdot p_{n,0}(n) \left( \sum_{i=0}^{n} \left( \begin{array}{c} n \\ i \end{array} \right) \right) \quad (n = d).
\]

**Theorem 3.** Let $d \in \mathbb{N}$ and let
\[ y = x_1 + \cdots + x_d. \]

Then, for $m, n \in \mathbb{N}^*$ ($m \geq n$),
\[
\sum_{i_1 + \cdots + i_d = m \atop (i_1, \ldots, i_d \geq 0)} \left( \begin{array}{c} m \\ i_1, \ldots, i_d \end{array} \right) [G_{i_1}(x_1; \lambda) + \cdots + G_{i_d}(x_d; \lambda)]^n
\]
\[
= \frac{(-2)^{d-1} (m+n)!}{(m+n-d)! \cdot (d-1)!} \sum_{i=1}^{d} s(d,i) \sum_{j=0}^{i-1} \left( \begin{array}{c} i-1 \\ j \end{array} \right) \frac{(-1)^j y^{i-j}}{m+n+j+1-d} G_{n+j+1-d}(y; \lambda).
\]

In its special case when $m = 0$, Theorem 3 immediately yields
\[
\left[ G_0(x_1; \lambda) + \cdots + G_0(x_d; \lambda) \right]^n
\]
\[
= \frac{(-2)^{d-1} n!}{(d-1)!} \sum_{i=1}^{d} \sum_{j=0}^{i-1} \left( \begin{array}{c} i-1 \\ j \end{array} \right) \frac{(-1)^j y^{i-j}}{m+n+j+1-d} G_{n+j+1-d}(y; \lambda) \quad (y = x_1 + \cdots + x_d; n, d \in \mathbb{N}; n \geq d).
\]

By a similar consideration to that for (19), we can obtain the following formula for the Apostol-Genocchi polynomials:
\[
\sum_{i_1 + \cdots + i_d = n \atop (i_1, \ldots, i_d \geq 0)} \left( \begin{array}{c} n \\ i_1, \ldots, i_d \end{array} \right) G_{i_1}(x_1; \lambda) \cdots G_{i_d}(x_d; \lambda)
\]
\[
= \frac{(-2)^{d-1} n!}{(d-1)!} \sum_{i=0}^{n-d} (-1)^{i} s(d,i) \sum_{j=0}^{i} \frac{G_{i+j}(\lambda)}{j! \cdot (n-d-j)! \cdot (i+j)} y^{n-d-j}
\]
\[
(y = x_1 + \cdots + x_d; n, d \in \mathbb{N}; n \geq d).
\]

By changing the order of the summation on the right-hand side of (23), we find that
\[
\sum_{i_1 + \cdots + i_d = n \atop (i_1, \ldots, i_d \geq 0)} \left( \begin{array}{c} n \\ i_1, \ldots, i_d \end{array} \right) G_{i_1}(x_1; \lambda) \cdots G_{i_d}(x_d; \lambda)
\]
\[
= 2^{d-1} \sum_{i=0}^{n-d} \left( \begin{array}{c} n \\ i \end{array} \right) 2^{i} \sum_{j=0}^{n} \frac{G_{i+j}(y; \lambda)}{n-j} y^{n-j}
\]
\[
(y = x_1 + \cdots + x_d; n, d \in \mathbb{N}; n \geq d).
\]

Finally, upon setting $\lambda = 1$ in (24), gives a formula for sums of products of the Genocchi polynomials, which is analogous to (21).
3. Proofs of Theorems

Before giving the proofs of Theorems 1–3, we recall the following auxiliary results which will be needed in our proofs.

**Lemma 1.** ([23] Theorem 3.1 and Theorem 3.2) Let \( \alpha, \lambda \in \mathbb{C} \) and \( n \in \mathbb{N}^* \). Then

\[
\frac{\partial^n}{\partial t^n} \left\{ \frac{1}{1 - \lambda e^{\alpha t}} \right\} = \alpha^n \sum_{k=1}^{n+1} \frac{(-1)^{n+1-k}}{(1 - \lambda e^{\alpha t})^k} (k-1)! \cdot S(n+1, k).
\]

Furthermore, for \( n \in \mathbb{N} \),

\[
\frac{1}{(1 - \lambda e^{\alpha t})^n} = \sum_{k=1}^{n} \frac{(-1)^{(n-k)}}{(n-1)! \cdot \alpha^{k-1} \partial^{k-1}} \left\{ \frac{1}{1 - \lambda e^{\alpha t}} \right\} \cdot s(n, k). \tag{25}
\]

**Lemma 2.** ([20] Equations (2.6) and (3.11)) Let \( n \in \mathbb{N}^* \). Then

\[
e^{xt} \frac{\partial^n}{\partial t^n} \{ F(y, t) \} = \sum_{m=0}^{\infty} \sum_{k=0}^{n} \binom{n}{k} (-x)^{n-k} f_{m+k}(x+y) \left( t^m \frac{m!}{m!} \right).
\]

Moreover, for \( r \in \mathbb{N} \),

\[
e^{xt} \frac{\partial^n}{\partial t^n} \{ G(y, t) \} = \sum_{m=0}^{\infty} \sum_{k=0}^{n} \binom{n}{k} (-x)^{n-k} f_{m+k+r}(x+y) \left( t^m \frac{m!}{(m+k+1)!} \right) + \frac{(-1)^{n+1} x^{m+n+1}}{(r-1)!} \int_0^1 t^m (1-t)^n f_{r-1}(x+y-xt) \, dt \left( t^m \frac{m!}{m!} \right), \tag{27}
\]

where

\[
F(y, t) = \sum_{m=0}^{\infty} f_m(y) \frac{t^m}{m!},
\]

\[
G(y, t) = \sum_{m=0}^{\infty} f_{m+r}(y) \frac{t^m}{(m+r)!}.
\]

and the sequence \( \{ f_n(x) \}_{n=0}^{\infty} \) is given as in Equation (15).

**Proof of Theorem 1.** First of all, by setting \( \alpha = 1 \) in (25), we get

\[
\frac{1}{(\lambda e^t - 1)^n} = \sum_{k=1}^{n} \frac{(-1)^{k-1}}{(n-1)! \partial^{k-1}} \left\{ \frac{1}{\lambda e^t - 1} \right\} \cdot s(n, k) \quad (n \in \mathbb{N}),
\]

which, for \( d \in \mathbb{N} \), yields

\[
\left( \frac{t^{1-x}}{a^d} \right)^d \cdot \sum_{j=1}^{d} (-1)^{j-1} \frac{t^{i+xj}}{(d-1)!} \frac{1}{(\frac{t^{1-x}}{a^d})^j} = \left( \frac{t^{1-x}}{a^d} \right)^d \cdot \sum_{j=1}^{d} (-1)^{j-1} \frac{t^{i+xj}}{(d-1)!} \frac{1}{(\frac{t^{1-x}}{a^d})^j} = \left( \frac{t^{1-x}}{a^d} \right)^d \cdot \sum_{j=1}^{d} (-1)^{j-1} \frac{t^{i+xj}}{(d-1)!} \frac{1}{(\frac{t^{1-x}}{a^d})^j} \cdot s(d, i). \tag{28}
\]

Let \( \nu \in \mathbb{N} \) and let the function \( f_\nu(t) \) be differentiable with respect to \( t \). If we set

\[
f_\nu(t) = \frac{2^{1-x_1} t^\nu}{\beta^\nu \cdot e^t - a^\nu} \cdot e^{x_1 t},
\]

**Proof of Theorem 2.** First of all, by setting \( \alpha = 1 \) in (25), we get
then it is clear from (5) that for $l \in \mathbb{N}^*$,

$$\frac{\partial^l}{\partial t^l} \{ f_v(t) \} = \sum_{n=0}^{\infty} \mathcal{Y}_{n+l,\beta}(x_v; \kappa, a, b) \frac{t^n}{n!}. \quad (29)$$

By differentiating both sides of (28) $m$ times with respect to $t$, with the help of the general Leibniz rule presented in [18] (pp. 130–133), we obtain

$$\sum_{i_1+\ldots+i_d=m} \left( \frac{\partial^l}{\partial t^l} \right) \{ f_1(t) \} \cdot \cdots \cdot \left( \frac{\partial^l}{\partial t^l} \right) \{ f_d(t) \} = \left( \frac{2^{1-k}}{\beta^k} \right)^d \sum_{i=1}^{d} \left( \frac{1}{(d-1)!} \right)^{n^2} \left\{ e^\beta \frac{\partial^{d-1}}{\partial t^{d-1}} \left\{ \frac{1}{d!} \right\} \cdot s(d,i) \right\}. \quad (30)$$

We now denote by $[m^l]f(t)$ the coefficient of $t^n$ in $f(t)$ for $n \in \mathbb{N}^*$. Then, by making use of the operation $\left[ \frac{m}{m} \right]$ on both sides of (30) in conjunction with (29), we find that

$$\sum_{i_1+\ldots+i_d=m} \left( \frac{\partial^{l-1}}{\partial t^{l-1}} \right) \left\{ \mathcal{Y}_{i_1,\beta}(x_{ij}; \kappa, a, b) + \cdots + \mathcal{Y}_{i_d,\beta}(x_{ij}; \kappa, a, b) \right\} = \left( \frac{2^{1-k}}{\beta^k} \right)^{d-l} \sum_{i=1}^{d} \left( \frac{1}{(d-1)!} \right)^{n^2} \left\{ e^\beta \frac{\partial^{d-1}}{\partial t^{d-1}} \left\{ \frac{1}{d!} \right\} \cdot \left\{ \frac{2^{1-k}}{\beta^k} \right\} \right\}. \quad (31)$$

Also, by using the Leibniz rule, we have

$$\frac{\partial^{l-1}}{\partial t^{l-1}} \left\{ \frac{2^{1-k}}{\beta^k e^t - a^\beta} \right\} = \frac{\partial^{l-1}}{\partial t^{l-1}} \left\{ \frac{2^{1-k}e^t}{\beta^k e^t - a^\beta} \cdot \frac{1}{t^k} \right\} \quad \text{and} \quad \frac{\partial^j}{\partial t^j} \left\{ \frac{1}{t^k} \right\} = (-1)^j \cdot \left( \frac{k+j-1}{j} \right) \frac{1}{t^{k+j}} \quad (j \in \mathbb{N}). \quad (32)$$

It follows from the above two identities that

$$t^\alpha e^{\beta t} \frac{\partial^{l-1}}{\partial t^{l-1}} \left\{ \frac{2^{1-k}e^t}{\beta^k e^t - a^\beta} \right\} = \sum_{j=0}^{l-1} (-1)^j \cdot \left( \frac{k+j-1}{j} \right) \frac{1}{t^{k+j}} \left\{ \frac{2^{1-k}e^t}{\beta^k e^t - a^\beta} \right\} \cdot \left( \frac{2^{1-k}e^t}{\beta^k e^t - a^\beta} \right) \cdot \left( \frac{k+j-1}{j} \right) \frac{1}{t^{k+j}} \quad (j \in \mathbb{N}). \quad (32)$$

If we replace $F(y, t)$ in (26) by

$$F(0, t) = \frac{2^{1-k}e^t}{\beta^k e^t - a^\beta} = \sum_{l=0}^{\infty} \mathcal{Y}_{l,\beta}(0; \kappa, a, b) \frac{t^l}{l!},$$

we find for $n \in \mathbb{N}^*$ that

$$e^{\beta t} \frac{\partial^n}{\partial t^n} \left\{ \frac{2^{1-k}e^t}{\beta^k e^t - a^\beta} \right\} = \sum_{l=0}^{\infty} \left[ \sum_{v=0}^{n} \left( \begin{array}{c} n \\ v \end{array} \right) (-1)^v \mathcal{Y}_{l+v,\beta}(x_v; \kappa, a, b) \right] \frac{t^l}{l!}. \quad (33)$$
Thus, by applying (33) to (32), we obtain

$$I^{\alpha} e^{\alpha t} \frac{\partial^{\alpha-1}}{\partial t^{\alpha-1}} \left\{ \frac{2^{1-k}}{e^t - a^b} \right\}$$

$$= \sum_{l=0}^{\infty} \sum_{j=0}^{i-1} \sum_{v=0}^{i-j-1} j! \cdot \binom{i-1}{j} \binom{i-1-j}{v} \binom{\kappa+j-1}{j} \cdot (-1)^{i-1-v} \frac{y^{i-1-j-v} J_{l+\nu,\beta}(y, \kappa, a, b)}{l!}.$$  

which readily yields

$$\frac{\partial^m}{\partial t^m} \left\{ I^{\alpha} e^{\alpha t} \frac{\partial^{\alpha-1}}{\partial t^{\alpha-1}} \left\{ \frac{2^{1-k}}{e^t - a^b} \right\} \right\} = m! \cdot \sum_{l=0}^{\infty} \sum_{j=0}^{i-1} \sum_{v=0}^{i-j-1} (-1)^{i-1-v} j! \cdot \binom{i-1}{j} \binom{i-1-j}{v} \binom{\kappa+j-1}{j} \cdot y^{i-1-j-v} J_{m+n+j+v-(d-1)\kappa,\beta}(y, \kappa, a, b) \cdot \frac{1}{(m+n+j-(d-1)\kappa)!}.$$  

(34)

Finally, Theorem 1 would follow by applying (34) to (31). □

**Proof of Theorem 2.** It is easily seen from (11) and (31) that, for \(d \in \mathbb{N}\) and \(m, n \in \mathbb{N}^+\),

$$\sum_{(l_1, \ldots, l_d) \geq 0} \left[ \sum_{i=1}^{n} B_i(x_i; \lambda) + \cdots + B_d(x_d; \lambda) \right]^m = \sum_{l=1}^{d} (-1)^{l-1} \left( \frac{m}{l!} \right) \frac{\partial^m}{\partial t^m} \left\{ \frac{1}{\lambda^{l-1}} \right\} \cdot s(d, i).$$  

(35)

Since \(B_0(x; \lambda) = 1\) when \(\lambda = 1\) and \(B_0(x; \lambda) = 0\) when \(\lambda \neq 1\), by setting

$$B_0(x; \lambda) = \delta_{1, \lambda},$$

we get

$$\frac{1}{\lambda^{l-1}} - \frac{\delta_{1, \lambda}}{t} = \sum_{l=0}^{\infty} B_{l+1}(0; \lambda) \frac{t^l}{(l+1)!},$$

where \(\delta_{1, \lambda}\) is the Kronecker symbol. Hence, by putting \(r = 1\) and replacing \(G(y, t)\) in (27) by

$$G(0, t) = \frac{1}{\lambda^{l-1}} - \frac{\delta_{1, \lambda}}{t} = \sum_{l=0}^{\infty} B_{l+1}(0; \lambda) \frac{t^l}{(l+1)!},$$
and making use of (17), we find for \( n \in \mathbb{N}^* \) that
\[
e^{xt} \frac{\partial^n}{\partial t^n} \left( \frac{1}{\lambda e^t - 1} - \frac{1}{\lambda e^t - 1} \right) = \sum_{l=0}^{\infty} \left[ \sum_{v=0}^{n} \binom{n}{v} \frac{(-x)^{n-v}}{l+v+1} B_{l+v+1}(x; \lambda) \right] t^l + (-1)^{n+1} \delta_{1, \lambda} \frac{n! \cdot l!}{(n + l + 1)!} x^{n+l+1} \]
which, together with the exponential series for \( e^{xt} \), yields
\[
e^{xt} \frac{\partial^n}{\partial t^n} \left\{ \frac{1}{\lambda e^t - 1} \right\} = \sum_{l=0}^{\infty} \left[ \sum_{v=0}^{n} \binom{n}{v} \frac{(-x)^{n-v} B_{l+v+1}(x; \lambda)}{l+v+1} \right] \frac{t^l}{l!} + (-1)^n n! \cdot \delta_{1, \lambda} \sum_{l=0}^{\infty} \frac{t^l \cdot 1}{l!} \cdot \frac{1}{l+1}.
\]

It follows from (36) that
\[
l^d e^{yt} \left\{ \frac{1}{\lambda e^t - 1} \right\} = \sum_{l=0}^{\infty} \left[ \sum_{v=0}^{i-1} \binom{i-1}{v} (-y)^{i-1-v} \frac{B_{l+v+1}(y; \lambda)}{l+v+1} \right] \frac{t^{l+i}}{l!} + (-1)^{i+1} \sum_{l=0}^{\infty} \frac{t^l \cdot 1}{l!} \cdot \frac{1}{l+1}.
\]

If we now partially differentiate both sides of (37) \( m \) times with respect to \( t \), then
\[
\frac{\partial^m}{\partial t^m} \left\{ l^d e^{yt} \left\{ \frac{1}{\lambda e^t - 1} \right\} \right\} = m! \sum_{l=0}^{\infty} \frac{t^l}{l!} \cdot \delta_{1, \lambda} \sum_{l=0}^{\infty} \frac{t^l \cdot 1}{l!} \cdot \frac{1}{l+1}.
\]
which, for \( m, n \in \mathbb{N}^* (m + n \geq d) \), yields
\[
\int \frac{\partial^m}{\partial t^m} \left\{ l^d e^{yt} \left\{ \frac{1}{\lambda e^t - 1} \right\} \right\} dt = \frac{(m+n)!}{(m+n-d)!} \sum_{l=0}^{\infty} \frac{t^l \cdot 1}{l!} \cdot \frac{1}{l+1} \cdot \frac{1}{l+2}.
\]

By applying (38) to (35), we are led to Theorem 2. \( \square \)

**Proof of Theorem 3.** From (11) and (31), we find for \( d \in \mathbb{N} \) and \( m, n \in \mathbb{N}^* \) that
\[
\sum_{i_1 \cdots i_d = \lambda} (i_1 \cdots i_d) \left[ G_{i_1}(x_1; \lambda) + \cdots + G_{i_d}(x_d; \lambda) \right] = (-2)^{d-1} \cdot \sum_{l=1}^{d} \frac{(-1)^{l-1} \cdot 1}{(d-l)!} \int \frac{x^d}{l^d} \left\{ \frac{1}{\lambda e^t - 1} \right\} \cdot s(d, i).
\]
Since (see, for example, [2])
\[
G_0(x; \lambda) = 0,
\]
by applying (3) we have
\[
\sum_{n=0}^{\infty} G_{n+1}(0; \lambda) \frac{t^n}{(n+1)!}.
\]

Hence, by setting \( r = 1 \) and taking
\[
G(0, t) = \frac{2}{\lambda e^t + 1}.
\]
in (27), we find for \( n \in \mathbb{N} \) that
\[
e^{yt} \frac{\partial^n}{\partial t^n} \left\{ \frac{2}{\lambda e^t + 1} \right\} = \sum_{l=0}^{\infty} \left[ \sum_{v=0}^{n} \binom{n}{v} (-x)^{n-v} \frac{G_{l+v+1}(x;\lambda)}{l+v+1} \right] \frac{t^l}{l!}. \tag{40}
\]

It follows from (40) that
\[
t^l e^{yt} \frac{\partial^{l-1}}{\partial t^{l-1}} \left\{ \frac{2}{\lambda e^t + 1} \right\} = \sum_{l=0}^{\infty} \left[ \sum_{v=0}^{l-1} \binom{l-1}{v} (-y)^{l-1-v} \frac{G_{l+v+1}(y;\lambda)}{l+v+1} \right] \frac{t^{l+1}}{l+1},
\]
which implies, for \( m \in \mathbb{N}^+ \) and \( i, d \in \mathbb{N} \), that
\[
\tilde{g}^m \left\{ t^l e^{yt} \frac{\partial^{l-1}}{\partial t^{l-1}} \left\{ \frac{2}{\lambda e^t + 1} \right\} \right\} = m! \cdot \sum_{l=0}^{\infty} \left[ \sum_{v=0}^{l-1} \binom{l-1}{v} (-y)^{l-1-v} \frac{G_{l+v+1}(y;\lambda)}{l+v+1} \right] \frac{t^{l+1-w}}{l+1}. \tag{41}
\]

By making use of (41), we find for \( m, n \in \mathbb{N}^+ \) and \( i, d \in \mathbb{N} \) that
\[
\left[ \frac{t^n}{n!} \right] \frac{\partial^m}{\partial t^m} \left\{ t^l e^{yt} \frac{\partial^{l-1}}{\partial t^{l-1}} \left\{ \frac{1}{\lambda e^t + 1} \right\} \right\} = \frac{(m+n)!}{(m+n-d)!} \sum_{i=0}^{l-1} \binom{l-1}{v} (-y)^{l-1-v} \frac{G_{m+n+v+1-d}(y;\lambda)}{m+n+v+1-d}. \tag{42}
\]

Finally, by applying (42) to (39), we conclude the proof of Theorem 3. \( \square \)

4. Conclusions and Observation

In the paper, we have given a systematic and unified investigation for the Apostol-Bernoulli polynomials, the Apostol-Euler polynomials and the Apostol-Genocchi polynomials. By applying the generating-function methods and summation-transform techniques, we have established some higher-order convolutions for the Apostol-Bernoulli polynomials, the Apostol-Euler polynomials and the Apostol-Genocchi polynomials.

The methods shown in this paper may be applied to other families of special polynomials. In a similar way, some results may be obtained.
