Abstract: The Resistance-Harary index of a connected graph $G$ is defined as $RH(G) = \sum_{\{u,v\} \subseteq V(G)} \frac{1}{r(u,v)}$, where $r(u,v)$ is the resistance distance between vertices $u$ and $v$ in $G$. A graph $G$ is called a unicyclic graph if it contains exactly one cycle and a fully loaded unicyclic graph is a unicyclic graph that no vertex with degree less than three in its unique cycle. Let $U(n)$ and $\overline{U}(n)$ be the set of unicyclic graphs and fully loaded unicyclic graphs of order $n$, respectively. In this paper, we determine the graphs of $U(n)$ with second-largest Resistance-Harary index and determine the graphs of $\overline{U}(n)$ with largest Resistance-Harary index.

Keywords: Resistance-Harary Index; resistance distance; unicyclic graphs; fully loaded unicyclic graphs

1. Introduction

The topological index is the mathematical descriptor of the molecular structure, which can effectively reflect the chemical structure and properties of the material. The famous Wiener index $W(G)$ (also Wiener number) introduced by H. Wiener, is a topological index of a molecule, defined as the sum of the lengths of the shortest paths between all pairs of vertices, i.e., $W(G) = \sum_{\{u,v\} \subseteq V(G)} d(u,v)$ in the chemical graph representing the non-hydrogen atoms in the molecule. In 1993, Klein and Randić [1] defined a new distance function named resistance distance on the basis of electrical network theory replacing each edge of a simple connected graph $G$ by a unit resistor. Let $G$ be a simple connected graph with vertices set $V = \{v_1, v_2, \ldots, v_n\}$. The resistance distance between the vertices $v_i$ and $v_j$, denoted by $r(v_i, v_j)$ (if more than one graphs are considered, we write $r_G(v_i, v_j)$ to avoid confusion), is defined to be the effective resistance between the vertices $v_i$ and $v_j$ in $G$. If the ordinary distance is replaced by resistance distance in the expression for the Wiener index, one arrives at the Kirchhoff index [1,2]

$$Kf(G) = \sum_{\{u,v\} \subseteq V(G)} r(u,v),$$

which has been widely studied [3–12].

Another distance-based graph invariant index named Harary index was introduced independently by Plavšić et al. [13] and by Ivanciuc et al. [14] in 1993 for the characterization of molecular graphs. The Harary index $H(G)$ is defined as

$$H(G) = \sum_{\{u,v\} \subseteq V(G)} \frac{1}{d(u,v)},$$
which is the sum of reciprocals of distances between all pairs of vertices of $G$. For more related results to Harary index, please refer to [15–22]. In 2017, Chen et al. [23,24] introduced a new graph invariant reciprocal to Kirchhoff index, named Resistance-Harary index, as

$$RH(G) = \sum_{\{u,v\} \subseteq V(G)} \frac{1}{r_{G}(u,v)}.$$ 

To understand the results and concepts, we introduce some definitions and notions. All of the graphs considered in this paper are connected and simple. A graph $G$ is called a unicyclic graph if it contains exactly one cycle, simply denoted as $G = U(C_{l}; T_{1}, T_{2}, \cdots, T_{l})$, where $C_{l}$ is the unique cycle with vertices $v_{1}v_{2}\cdots v_{l}$, $T_{i}$ is a tree rooted at $v_{i}$, $1 \leq i \leq l$. A fully loaded unicyclic graph is a unicyclic graph with the property that there is no vertex with degree less than three in its unique cycle. Let $S_{l}$ denote the graph obtained from cycle $C_{l}$ by adding $n - l$ pendant edges to a vertex of $C_{l}$. Let $U(n;l)$ be the set of unicyclic graphs with $n$ vertices and the unique cycle $C_{l}$ and $U(n)$ be the set of unicyclic graphs with $n$ vertices. Let $U(n;l)$ be the set of all fully loaded unicyclic graphs with $n$ vertices and the unique cycle $C_{l}$ and $U(n)$ be the set of unicyclic graphs with $n$ vertices. Let $S_{n}$ and $P_{n}$ be the star and the path on $n$ vertices, respectively.

In this paper, we improve the results of the recent paper (Chen et al. [23]) and we determine the largest Resistance-Harary index among all unicyclic graphs. Additionally, we determine the second-largest Resistance-Harary index among all unicyclic graphs and determine the largest Resistance-Harary index among all fully loaded unicyclic graphs and characterize the corresponding extremal graphs, respectively.

2. Preliminaries

In this section, we introduce some useful lemmas and two transformations. Let $R_{G}(u) = \sum_{v \in V(G) \backslash \{u\}} \frac{1}{r_{G}(u,v)}$, then $RH(G) = \frac{1}{2} \sum_{u \in V(G)} R_{G}(u)$. Let $C_{g} = v_{1}v_{2}\cdots v_{g}v_{1}$ be the cycle on $g$ vertices where $g \geq 3$. By Ohm’s law, for any two vertices $v_{i}, v_{j} \in V(C_{g})$ with $i < j$, one has

$$r_{C_{g}}(v_{i}, v_{j}) = \frac{(j-i)(g+j-i)}{g}.$$ 

By a simple calculation, we can obtain the Resistance-Harary index of $C_{g}$, which is

$$RH(C_{g}) = \sum_{u \in V(C_{g})} \frac{1}{2} R_{C_{g}}(v) = g \sum_{i=1}^{g-1} \frac{1}{i}.$$ 

**Lemma 1 ([11]).** Let $x$ be a cut vertex of a connected graph $G$ and let $a$ and $b$ be vertices occurring in different components which arise upon deletion of $x$. Then,

$$r_{G}(a,b) = r_{G}(a,x) + r_{G}(x,b).$$

**Definition 1 ([23]).** Let $v$ be a vertex of degree $p + 1$ in a graph $G$, such that $vv_{1}, vv_{2}, \ldots, vv_{p}$ are pendent edges incident with $v$, and $u$ is the neighbor of $v$ distinct from $v_{1}, v_{2}, \ldots, v_{p}$. We form a graph $G' = \sigma(G,v)$ by deleting the edges $vv_{1}, vv_{2}, \ldots, vv_{p}$ and adding new edges $uv_{1}, uv_{2}, \ldots, uv_{p}$. We say that $G'$ is a $\sigma$-transform of the graph $G$ (see Figure 1).

![Figure 1](image-url)
Lemma 2 ([23]). Let \( G' = \sigma(G, v) \) be a \( \sigma \)-transform from the graph \( G \), \( d(u) \geq 1 \) described in Figure 1. Then, \( RH(G') \geq RH(G) \), with equality holds if and only if \( G \) is a star with \( v \) as its center.

Definition 2 ([23]). Let \( u, v \) be two vertices in a graph \( G \), such that \( u_1, u_2, \ldots, u_s \) are pendants incident with \( u \) and \( v_1, v_2, \ldots, v_t \) are pendants incident with \( v \) in \( G_0 \subseteq G \), respectively. \( G' \) and \( G'' \) are two graphs \( \beta \)-transformed from \( G \), such that \( G' = G - \{vv_1, vv_2, \ldots, vv_t\} + \{uv_1, uv_2, \ldots, uv_t\} \), \( G'' = G - \{vv_1, vv_2, \ldots, vv_t\} + \{uv_1, uv_2, \ldots, uv_t\} \), (see Figure 2).

![Figure 2. The \( \beta \)-transform.](image)

Lemma 3 ([23]). Let \( G', G'' \) be the graphs transformed from the graph \( G \), \( d(u) \geq 1 \) described in Figure 2. Then, \( RH(G) < RH(G') \), or \( RH(G) < RH(G'') \).

Corollary 1 ([23]). Let \( G \) be a connected graph with \( u, v \in V(G) \). Denote by \( G(s; t) \) the graph obtained by attaching \( s > 1 \) pendant vertices to vertex \( u \) and \( t > 1 \) pendant vertices to vertex \( v \). Then, we have \( RH(G(1, s + t - 1)) > RH(G) \) or \( RH(G(s + t - 1, 1)) > RH(G) \).

Lemma 4. The function \( f(x) = \frac{2(k-1)}{(x+1)(k-1)-x^2} - \frac{1}{x+1} - \frac{1}{2} - \frac{2}{x^2} \) for \( k \geq 3 \) and \( 1 \leq x \leq \frac{k-1}{2} \) is strictly decreasing.

**Proof.** By simple calculation,

\[
f'(x) = \frac{2(1-k)(k-2x-1)}{(k+1)(k-1)-x^2} - \frac{1}{(k-1)^2} + \frac{1}{(x+1)^2} = (k-2x-1)\left(\frac{2(1-k)}{(k+1)(k-1)-x^2} - \frac{1}{(x+1)^2}\right) + \frac{(k-1)}{(x+1)^2(k-x)}
\]

Let \( g(x) = \frac{2(1-k)}{(k+1)(k-1)-x^2} + \frac{(k-1)}{(x+1)^2(k-x)} \), then we have \( g'(x) = \frac{2(k+1)}{(x+1)^2(k-x)^2} - \frac{2(1-k)}{(x+1)^2} - \frac{2(k+1)}{(x+1)(k-2)^2} < 0 \) since \( 1 \leq x \leq \frac{k-1}{2} \) and \( g(1) = \frac{2(1-k)}{4k^2-12k+9} - \frac{k+1}{4k^2-8k+4} < 0 \) since \( k \geq 3 \). Thus, \( g(x) < 0 \), since \( 1 \leq x \leq \frac{k-1}{2} \). It follows that \( f'(x) < 0 \), since \( 1 \leq x \leq \frac{k-1}{2} \) and \( k \geq 3 \), thus implying the conclusion of the theorem. \( \square \)

3. Main Results

By Lemmas 2 and 3, we claim that \( RH(G) \leq RH(S^u_0) \) if \( G \in \mathcal{U}(n; g) \). Next, we will determine the graphs in \( \mathcal{U}(n) \) with the largest Resistance-Harary index and the second-largest Resistance-Harary index.
3.1. The Largest Resistance-Harary Index

Theorem 1. If \( G \in \mathcal{U}(n) \), then

\[
\max_{G \in \mathcal{U}(n)} \{ RH(G) \} = \begin{cases} 
    RH(C_n) & \text{if } n \leq 7, \\
    RH(S^g_8) & \text{if } n = 8, \\
    RH(S^g_9) & \text{if } 9 \leq n \leq 15, \\
    RH(S^g_9) & \text{if } n \geq 16.
\end{cases}
\]

Proof. Let \( H = G - C_g \), by the definition of Resistance-Harary index, one has,

\[
RH(S^g_8) = \sum_{\{u,v\} \subseteq V(G)} \frac{1}{r(u,v)} - \sum_{\{u,v\} \subseteq V(C_g)} \frac{1}{r(u,v)} = g \left( 1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{g-1} \right) + \frac{1}{4} (n-g)(n+3-g) + g(n-g) \left( \frac{1}{2g-1} + \frac{1}{3g-4} + \cdots + \frac{1}{g^2-(g-1)^2} \right).
\]

Similarly,

\[
RH(S^g_{n-1}) = (g-1) \left( 1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{g-2} \right) + \frac{1}{4} (n+1-g) (n+4-g) + (g-1)(n+1-g) \left( \frac{1}{2g-3} + \frac{1}{3g-7} + \cdots + \frac{1}{(g-1)^2-(g-2)^2} \right).
\]

Further, by the symmetry of \( C_g \), one has,

\[
\Delta = RH(S^g_{n-1}) - RH(S^g_8) = (g-1)(n+1-g) \left( \frac{1}{2g-3} + \frac{1}{3g-7} + \cdots + \frac{1}{(g-1)^2-(g-2)^2} \right)
\]

\[
+ \frac{1}{2} (n-g) - g(n-g) \left( \frac{1}{2g-1} + \frac{1}{3g-4} + \cdots + \frac{1}{g^2-(g-1)^2} \right) - \left( 1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{g-1} \right)
\]

\[
= (n-g) \left[ \left( \frac{g-1}{2g-3} + \frac{g-1}{3g-7} + \cdots + \frac{g-1}{2g-3} \right) + \frac{1}{2g-1} + \frac{1}{3g-4} + \cdots + \frac{1}{g^2-(g-1)^2} \right] - \left( \frac{g}{2g-1} + \frac{g}{3g-4} + \cdots + \frac{g}{2g-1} \right) + (g-1) \left( \frac{1}{2g-3} + \frac{1}{3g-7} + \cdots + \frac{1}{(g-1)^2-(g-2)^2} \right)
\]

To explore the relationship between \( \Delta \) and parameters \( g \), we first discuss the part of the first brace of Equation (1). Let

\[
\Theta_1 = \left( \frac{g-1}{2g-3} + \frac{g-1}{3g-7} + \cdots + \frac{g-1}{2g-3} \right) + \frac{1}{2g-1} + \frac{g}{3g-4} + \cdots + \frac{g}{2g-1},
\]

\[
\Theta_2 = \left( \frac{g}{2g-1} + \frac{g}{3g-4} + \cdots + \frac{g}{2g-1} \right) + (g-1) \left( \frac{1}{2g-3} + \frac{1}{3g-7} + \cdots + \frac{1}{(g-1)^2-(g-2)^2} \right).
\]
then
\[
\Theta_1 = \begin{cases} 
\left(\frac{g-1}{2g-3} - \frac{g}{2g-1}\right) + \left(\frac{g-1}{2g-7} - \frac{g}{2g-5}\right) + \ldots + \left(\frac{g-1}{2g-3g} - \frac{g}{2g-1}\right) \\
\frac{1}{4} - \frac{4}{8} > 0, & \text{if } g \geq 4 \text{ and } g \text{ is even,} \\
\left(\frac{g-1}{2g-3} - \frac{g}{2g-1}\right) + \left(\frac{g-1}{2g-7} - \frac{g}{2g-5}\right) + \ldots + \left(\frac{g-1}{2g-3g} - \frac{g}{2g-1}\right) \\
\frac{1}{4} - \frac{4}{(8g-2)^2} > 0, & \text{if } g \geq 5 \text{ and } g \text{ is odd.}
\end{cases}
\]

Next, we consider the rest of Equation (1). Let
\[
\Theta_2 = (g-1)\left(\frac{1}{2g-3} + \frac{1}{3g-7} + \ldots + \frac{1}{(g-1)^2 - (g-2)^2}\right) - \left(1 + \frac{1}{2} + \frac{1}{3} + \ldots + \frac{1}{g-1}\right).
\]

(i) If \(g\) is even, then
\[
\Theta_2 = (g-1)\sum_{i=1}^{\frac{g}{2}-2} \frac{1}{(i+1)(g-1) - i^2} - \sum_{i=1}^{\frac{g}{2}-1} \frac{1}{i}
= \sum_{i=1}^{\frac{g}{2}-1} \frac{2(g-1)}{(i+1)(g-1) - i^2} - \left(\sum_{i=1}^{\frac{g}{2}-1} \frac{1}{i+1} + 1\right)
= \sum_{i=1}^{\frac{g}{2}-1} \frac{2(g-1)}{(i+1)(g-1) - i^2} - \left[\sum_{i=1}^{\frac{g}{2}-1} \left(\frac{1}{i+1} + \frac{1}{g-i}\right) + \left(\frac{2}{g-2} + \frac{2}{g-2} + \ldots + \frac{2}{g-2}\right)\right]^{\frac{g}{2}-1}
= \sum_{i=1}^{\frac{g}{2}-1} \left[\frac{2(g-1)}{(i+1)(g-1) - i^2} - \frac{1}{i+1} - \frac{1}{g-i} - \frac{2}{g-2}\right].
\]

By Lemma 4, the function
\[
F(x) = \frac{2(g-1)}{(x+1)(g-1) - x^2} - \frac{1}{x+1} - \frac{1}{g-x} - \frac{2}{g-2}
\]
is a monotonically decreasing function on \([1, \frac{g-1}{2}]\). Thus, when \(x = \frac{g-1}{2}\), \(F(x)\) get the minimum value
\[
F\left(\frac{g-2}{2}\right) = \frac{8(g-1)}{g^2 + 2g - 4} - \frac{2}{g-2} - \frac{2}{g} - \frac{2}{g+2},
\]
since
\[
g \to \infty, F\left(\frac{g-2}{2}\right) \to \frac{2}{g} > 0.
\]

Actually, by simple calculation, we have \(F(x) > 0\) when \(g \geq 8\), it follows that \(\Theta_2 > 0\) when \(g \geq 8\).

(ii) Using the same argument as Equation (1), we can check that if \(g\) is an odd integer, \(\Theta_2 > 0\) for all \(g \geq 8\).

Comparing \(\Theta_1\) and \(\Theta_2\), it is easy to see that
\[
RH(S_n^g) < RH(S_n^{g-1}),
\]
since \(g \geq 8\). For \(g = 3, 4, \ldots, 7\), we calculate \(RH(S_3^g), RH(S_4^g), RH(S_5^g), RH(S_6^g), RH(S_7^g)\) and compare the values. We have
Theorem 2. \[
\text{Let } G 
\]

However, \( RH(S^3_n) = 25.5476, RH(S^3_n) < RH(S^5_n) \), is a contradiction. If \( n = 8 \), according to the Theorem 2 in [23], the result is \( RH(C_8) = 20.7429 \) has the largest value. However, \( RH(S^5_8) = 20.9773, RH(C_8) < RH(S^5_8) \), is a contradiction. Actually, according to our Theorem 1, we have \( RH(S^5_8) > RH(C_8) \) if \( n = 9 \) and \( RH(S^5_8) > RH(C_8) \) if \( n = 8 \). Obviously, the result is consistent with our theorem.
3.2. The Second-Maximum Resistance-Harary Index

By Lemmas 2 and 3 and Equation (2) of the proof of Theorem 1, we can conclude that for \( n \geq 16 \) which has the second-largest Resistance-Harary index in \( U(n) \) and those must be one of the graphs \( G_1, G_2, \) and \( G_3(S_n^4) \), as shown in Figure 3.

![Figure 3. The graphs \( G_1, G_2 \) and \( G_3(S_n^4) \).](image)

**Theorem 3.** If \( G \in U(n) \), let \( \text{max}^* \{ RH(G) \} \) denote the second-largest Resistance-Harary index of graph \( G \), then

\[
\text{max}^* \{ RH(G) \} = \begin{cases} 
    RH(S_n^{n-1}) & \text{if } n \leq 7, \\
    RH(S_n^4) & \text{if } n = 8, \\
    RH(S_n^5) & \text{if } n = 9, 10, \\
    RH(S_n^3) & \text{if } 11 \leq n \leq 15, \\
    RH(S_n^4) & \text{if } n \geq 16.
\end{cases}
\]

**Proof.** (i) For \( n \geq 16 \).

**Case 1.** Let \( H_1 \) be the common subgraph of \( S_n^3 \) and \( G_1 \). Thus, we can view graphs \( S_n^3 \) and \( G_1 \) as the graphs depicted in Figure 4.

Then, we have

\[
RH(S_n^3) = RH(H_1) + \frac{1}{2} + 2 \sum_{x \in H_1} \frac{1}{1 + r(x, v_1)} \\
= RH(H_1) + \frac{1}{2} + 2 \left[ 1 + \frac{n - 5}{2} + \frac{6}{5} \right],
\]

\[
RH(G_3) = RH(H_1) + 1 + \sum_{x \in H_2} \frac{1}{1 + r(x, v_1)} + \sum_{x \in H_2} \frac{1}{2 + r(x, v_1)} \\
= RH(H_1) + 1 + \left( 1 + \frac{6}{5} + \frac{n - 5}{2} + \frac{1}{2} + \frac{n - 5}{3} + \frac{3}{4} \right).
\]

Therefore, we can get the difference

\[
RH(S_n^3) - RH(G_1) = \frac{n}{6} - \frac{23}{60}.
\]
Case 2. Let $H_2$ be the common subgraph of $S_n^3$ and $G_2$. Thus, we can view graphs $S_n^3$ and $G_2$ as the graphs depicted in Figure 5.

Then, we have

$$RH(S_n^3) = RH(S_n^3) + \sum_{x \in H_2} \frac{1}{1 + r(x, v_1)}$$
$$= RH(H_2) + \left[1 + \frac{n - 4}{2} + \frac{6}{5}\right].$$

$$RH(G_2) = RH(H_2) + \sum_{x \in H_2} \frac{1}{1 + r(x, v_2)}$$
$$= RH(H_2) + \left[1 + \frac{3(n - 4)}{8} + \frac{6}{5}\right].$$

Therefore, we can get the difference

$$RH(S_n^3) - RH(G_2) = \frac{n}{8} - \frac{1}{2}.$$

Case 3. Let $H_3$ be the common subgraph of $S_n^3$ and $G_3$. Thus, we can view graphs $S_n^3$ and $G_3$ as the graphs depicted in Figure 6.
Then, we have
\[
RH(S_3^n) = RH(H_3) + RH(S_4^3) + \sum_{x \in H_3, y \in S_4^3} \frac{1}{r(x, y)}
\]
\[
= RH(H_3) + \frac{67}{10} + \frac{27(n - 4)}{10},
\]
\[
RH(G_3) = RH(H_3) + RH(C_4) + \sum_{x \in H_3, y \in C_4} \frac{1}{r(x, y)}
\]
\[
= RH(H_3) + \frac{22}{3} + \frac{37(n - 4)}{14}.
\]

Therefore, we can get the difference
\[
RH(S_3^n) - RH(G_3) = \frac{2n}{35} - \frac{181}{210}.
\]

By the above expressions for the Resistance-Harary index of \(G_1, G_2\) and \(G_3\), we immediately have the desired result.

**Figure 6.** The graphs \(S_3^n\) and \(G_3\).

(ii) For \(9 \leq n \leq 15\).

By the same arguments as used in (i), we conclude that the possible candidates having the second-largest Resistance-Harary index must be one of the graphs \(G_4, G_5, G_6, G_7(S_5^n)\) (as shown in Figure 7) and \(S_3^n\).

**Figure 7.** The graphs \(G_4 - G_7\).

Let \(H_4, H_5, H_6\) denote the common subgraphs of \(S_4^n\) and \(G_4 - G_7\), respectively. Thus, we can view graphs \(G_4 - G_7\) as the graphs depicted in Figure 8.
Then, in a similar way, we have

\[
\begin{align*}
RH(S_n^4) - RH(G_4) &= \frac{n}{6} - \frac{193}{462}, \\
RH(S_n^4) - RH(G_5) &= \frac{n}{27} - \frac{15}{22}, \\
RH(S_n^4) - RH(G_6) &= \frac{n}{5} - \frac{5}{22}, \\
RH(S_n^4) - RH(G_7) &= \frac{85}{693} - \frac{221}{2772}.
\end{align*}
\]

Therefore, we have \( HR(G_4) < HR(G_5) < HR(G_6) < HR(G_7) \). In connection with Equation (2), we have \( G_7(S_n^5) < S_n^3 \) if \( 11 \leq n \leq 15 \), so for \( 11 \leq n \leq 15 \), \( S_n^3 \) is the second largest. For \( n = 9, 10 \), in connection with Equation (2), we have \( S_n^5 \) is the second largest.

(iii) For \( n \leq 7 \) and \( n = 8 \).

In connection with Equation (2), we have \( S_n^{n-1}, S_n^4 \) is the second largest, respectively.

The result follows.

4. Application

Now, we give a specific application of formation mentioned in the Section 3. Fully loaded graphs as a special class of unicyclic graphs also have some special properties about Resistance-Harary index. In this section, we determine the largest Resistance-Harary index among all fully loaded unicyclic graphs.

By a sequence of \( \alpha \) and \( \beta \) transformations to a fully loaded graph \( G \), we can obtain a new graph, denoted by \( Q_l^n \), which is obtained by attaching a pendent edge to each vertex of the unique cycle \( C_l \) and attaching \( n - 2l + 1 \) pendent edges to a vertex of \( C_l \). Then, by Lemma 2 and Corollary 1, we arrive at

**Theorem 4.** \( G \in \mathcal{U}(n; g) \), then \( RH(G) \leq RH(Q_l^n) \).

Next, we determine the graph in \( \mathcal{U}(n) \) with the largest Resistance-Harary index.

**Theorem 5.** If \( G \in \mathcal{U}(n) \), then

\[
\max_{G \in \mathcal{U}(n)} \{ RH(G) \} = \begin{cases} 
RH(Q_l^3) & \text{if } n \leq 7, \\
RH(Q_l^4) & \text{if } n = 8, 9, \\
RH(Q_l^5) & \text{if } n \geq 10.
\end{cases}
\]

**Proof.** Using a similar way as in Section 3.2, we can conclude that the unicyclic graphs with \( n \geq 16 \) in Figure 9 have the second largest or third largest Resistance-Harary index.
Figure 9. The graphs with second maximal or third maximal Resistance-Harary index.

Only one graph $Q^7_n$ is fully loaded (Graph 9 in Figure 9). Thus, $Q^3_n$ has the largest Resistance-Harary index among all fully loaded graphs with $n \geq 16$. For $n \leq 15$, from Lemmas 2 and 3 we can conclude that the fully loaded graph with largest Resistance-Harary index must be one of the five situations $Q^3_n, Q^4_n, Q^5_n, Q^6_n, Q^7_n$.

For completeness of the proof, we list all possible values as follows. For $n \leq 7$, there is only one situation $Q^3_7$ with $n = 7$ and $Q^3_6$ with $n = 6$, so we begin at $n = 8$.

Case 1. $n = 8$.

$$RH(Q^3_8) = 19.625, \quad RH(Q^5_8) = 20.026.$$  

Then, $\max_{G \in \mathcal{U}(n)} \{RH(G)\} = RH(Q^5_8)$.

Case 2. $n = 9$.

$$RH(Q^3_9) = 24.075, \quad RH(Q^5_9) = 24.229.$$  

Then, $\max_{G \in \mathcal{U}(n)} \{RH(G)\} = RH(Q^5_9)$.

Case 3. $n = 10$.

$$RH(Q^3_{10}) = 29.025, \quad RH(Q^4_{10}) = 28.933, \quad RH(Q^5_{10}) = 28.866.$$  

Then, $\max_{G \in \mathcal{U}(n)} \{RH(G)\} = RH(Q^5_{10})$.

Case 4. $n = 11$.

$$RH(Q^3_{11}) = 34.475, \quad RH(Q^4_{11}) = 34.136, \quad RH(Q^5_{11}) = 33.725.$$  

Then, $\max_{G \in \mathcal{U}(n)} \{RH(G)\} = RH(Q^5_{11})$.

Case 5. $n = 12$.

$$RH(Q^3_{12}) = 40.425, \quad RH(Q^4_{12}) = 39.840, \quad RH(Q^5_{12}) = 39.085, \quad RH(Q^6_{12}) = 38.563.$$  

Then, $\max_{G \in \mathcal{U}(n)} \{RH(G)\} = RH(Q^5_{12})$.

Case 6. $n = 13$.

$$RH(Q^3_{13}) = 46.875, \quad RH(Q^4_{13}) = 46.043, \quad RH(Q^5_{13}) = 44.944, \quad RH(Q^6_{13}) = 44.003.$$
Then, max\( G \in \mathcal{U}(n) \) \{RH(G)\} = RH\( Q_3^{13} \).

Case 7. \( n = 14 \).

\[
\begin{align*}
RH(Q_3^{14}) &= 53.825, \quad RH(Q_4^{14}) = 52.747, \quad RH(Q_5^{14}) = 51.303, \\
RH(Q_6^{14}) &= 49.942, \quad RH(Q_7^{14}) = 49.987.
\end{align*}
\]

Then, max\( G \in \mathcal{U}(n) \) \{RH(G)\} = RH\( Q_3^{14} \).

Case 8. \( n = 15 \).

\[
\begin{align*}
RH(Q_3^{15}) &= 61.275, \quad RH(Q_4^{15}) = 59.950, \quad RH(Q_5^{15}) = 58.163, \\
RH(Q_6^{15}) &= 56.382, \quad RH(Q_7^{15}) = 54.946.
\end{align*}
\]

Then, max\( G \in \mathcal{U}(n) \) \{RH(G)\} = RH\( Q_3^{15} \).

The proof is completed. \( \square \)

5. Conclusions

This paper focuses on Resistance-Harary index in unicyclic graphs. Let \( \mathcal{U}(n) \) and \( \mathcal{U}(n) \) be the set of unicyclic graphs and fully loaded unicyclic graphs, respectively. Here, we first give a more precise proof about the largest Resistance-Harary index among all unicyclic graphs, then determine the graph of \( \mathcal{U}(n) \) with second-largest Resistance-Harary index and apply this way to fully loaded unicyclic graphs determine the graph of \( \mathcal{U}(n) \) with largest Resistance-Harary index.
