Abstract: There are numerous models for solving the efficiency evaluation in data envelopment analysis (DEA) with fuzzy input and output data. However, because of the limitation of those strategies, they cannot be implemented for solving fully fuzzy DEA (FFDEA). Furthermore, in real-world problems with imprecise data, fuzziness is not sufficient to consider, and the reliability of the information is also very vital. To overcome these flaws, this paper presented a new method for solving the fully fuzzy DEA model where all parameters are Z-numbers. The new approach is primarily based on crisp linear programming and has a simple structure. Moreover, it is proved that the only existing method to solve FFDEA with Z-numbers is not valid. An example is also presented to illustrate the efficiency of our proposed method and provide an explanation for the content of the paper.

Keywords: data envelopment analysis; Z-numbers; full fuzzy environment; fuzzy efficiency

1. Introduction

Data envelopment analysis (DEA) is a linear programming method for measuring the relative efficiencies of homogeneous decision-making units (DMUs) without knowing production functions (i.e., just by utilizing input and output information) [1,2]. The DEA technique has just been effectively connected in various cases such as broadcasting companies, banking institutions, R&D organizations, health care services, manufacturing, telecommunications, and supply chain management. Classical DEA models, such as CCR and BCC models [1,2], need crisp inputs and outputs, which are not typically accessible in real-world applications. However, the observed values of the input and output information in real-world issues are imprecise or vague [3–12] and imprecise evaluations could also be the end result of the unquantifiable, incomplete and non-available facts.

It is beneficial to consider the information of experts about the parameters as fuzzy data. The idea of the fuzzy set became established in [13]. After this, many researchers have applied this theory to different problems; see [14–22] and references therein. There are also many studies reported utilizing fuzzy set theory in DEA; see [23–33] and references therein.

Sengupta was the first to analyze DEA models in a fuzzy environment [23]. Triantis and Girod [24] combine DEA and fuzzy parametric programming to handle random measurement errors in input and output data. Kao and Liu [24] accompanied the simple concept of transforming a fuzzy DEA model to a crisp DEA model and presented an approach to measure the efficiencies of the DMUs. According to fuzzy arithmetic operations and fuzzy comparisons among fuzzy numbers, Dia [26] planned a model of fuzzy DEA (FDEA). Garcia et al. [27] applied the possibility of DEA version for failure mode and effects analysis (FMEA) and proposed a fuzzy DEA method to figure out ranking indices. Wang et al. [28] developed fuzzy DEA models with fuzzy inputs and outputs.
through fuzzy arithmetic. To obtain the efficiencies of DMUs as fuzzy numbers, they converted the proposed fuzzy DEA models into three linear programming (LP) models. Wang and Chin [29] utilized a fuzzy expected value approach and suggested the optimistic and the pessimistic efficiencies to solve FDEA. Emrouznejad et al. [30] presented a taxonomy of the FDEA methods and provided a classification scheme with six categories. Puri and Yadav [31] applied the $\alpha$-cut approach and provided a cross-efficiency technique for a fuzzy DEA model with undesirable fuzzy outputs. Wanke et al. [32] developed a new FDEA model and, using the bootstrap-truncated regressions, evaluated the efficiency of the Mozambican Banks. Hatami-Marbini et al. [33] proposed a comprehensive cross-efficiency fuzzy DEA approach for supplier evaluation. Readers can also refer to [34–43] for reviews of more recent research on fuzzy DEA approaches.

However, because of the limitations of the above methods, they cannot be implemented for solving fully fuzzy DEA (FFDEA), where all the inputs and outputs, as well as the decision variables, are fuzzy numbers. To the best of our knowledge, there is not much research on FFDEA. Hatami-Marbini et al. [44] utilized a fully fuzzy linear programming problem presented by an FFDEA model. Kazemi and Alimi [45] proposed an FFDEA model based on the ranking function. The feature of this proposed model is that it considers three situations for the problem and solves them simultaneously. Puri and Yadav [46] developed a new FFDEA model with undesirable factors and applied this model on multi-component FFDEA. Khaleghi et al. [47], based on simplex techniques and multi-objective optimization, obtain the fuzzy efficiency of FFDEA model.

Although the fuzzy set theory has been introduced as a powerful tool to quantify vague data, and several authors have suggested various fuzzy methods in DEA, there is a key inadequacy in past methodologies. A critical problem is that in classical fuzzy sets, the degree of sureness of information is not taken into account. When dealing with real information, fuzziness is not enough to take into account and the reliability of the information is vital. Recently, Sotoudeh-Anvari et al. [48] suggested a new FFDEA in a fuzzy situation with Z-numbers. The Z-number is a novel fuzzy notion which has more potential to articulate the vague circumstances of real applications. A Z-number has two components used to express a value of an arbitrary variable $X$, $Z = (A, B)$, where $A$ is an assessment of a value of $X$ and $B$ is an assessment of certainty of $A$ [49]. Sotoudeh-Anvari et al.’s model [48] is based on Kang et al.’s [50] and Allahviranloo et al.’s [51] methods and has low computational intricacy. However, the method has some flaws and is not valid.

In this paper, it is shown that the mentioned model is not true. To solve this drawback, we improved the model and propose a new algorithm. The rest of this work is ordered as follows: Section 2 presents some essential concepts regarding fuzzy set theory and converting a Z-number into a fuzzy number. In Section 3, we study the DEA, fuzzy DEA and fully fuzzified DEA models, briefly. Sotoudeh-Anvari et al.’s model [48] is reviewed in Section 4. Section 5 explains the shortcoming of the existing model [48]. The new FFDEA model with Z-numbers is also proposed in this section. A numerical example is given in Section 6. Finally, the paper is concluded.

2. Preliminaries

We start with some fundamental notations and starter results that we seek advice from later. For details, we refer to [1,13,18,21,48–50].

2.1. Definitions

**Definition 1** [18]. A fuzzy subset $\tilde{A}$ of a set $X$ is defined by its membership function $\mu_{\tilde{A}} : X \rightarrow [0, 1]$, where the value of $\mu_{\tilde{A}}(x)$ at $x$ shows the grade of membership of $x$ in $\tilde{A}$. 

Definition 2 [18]. A triangular fuzzy number (TFNs) \( \tilde{A} \) can be defined by \((a, b, c)\), where \( c \geq b \geq a \). The membership function \( \mu_{\tilde{A}}(x) \) is given by (1):

\[
\mu_{\tilde{A}}(x) = \begin{cases} 
\frac{x-a}{b-a} & a \leq x \leq b \\
\frac{x-c}{c-b} & b \leq x \leq c \\
0 & \text{otherwise}
\end{cases}
\]

Definition 3 [21]. Let \( \tilde{A} = (a, b, c) \) be a triangular fuzzy number. Then \( \tilde{A} \) is called a non-negative fuzzy number if and only if \( a \geq 0 \).

Definition 4 [21]. Let \( \tilde{A} = (a, b, c) \) be a triangular fuzzy number. Then \( \tilde{A} \) is called an unrestricted fuzzy number if \( a, b, c \in \mathbb{R} \).

Definition 5 [21]. Consider \( \tilde{A} = (a, b, c) \) and \( \tilde{B} = (d, e, f) \) as two triangular fuzzy numbers, then we have:

(i) \( \tilde{A} \oplus \tilde{B} = (a, b, c) \oplus (d, e, f) = (a + d, b + e, c + f) \),

(ii) \( \tilde{A} - \tilde{B} = (a, b, c) - (d, e, f) = (a - f, b - e, c - d) \),

(iii) \( \tilde{A} \odot \tilde{B} = (\min(\gamma), \max(\gamma)) \) where, \( \gamma = \{ad, af, cd, cf\} \).

Definition 6 [21]. Consider \( \tilde{A} = (a, b, c) \) and \( \tilde{B} = (d, e, f) \) as two triangular fuzzy numbers. Then these numbers are equal if and only if \( a = d, b = e \) and \( c = f \).

Definition 7 [21]. Consider \( \tilde{A} = (a, b, c) \) as a triangular fuzzy number. Then the ranking function of \( \tilde{A} \) is defined as follows:

\[
R(\tilde{A}) = \frac{1}{4}(a + 2b + c)
\]

Definition 8 [21]. Suppose \( \tilde{A} \) and \( \tilde{B} \) be two triangular fuzzy numbers, then

(i) \( \tilde{A} \leq \tilde{B} \) if and only if \( R(\tilde{A}) \leq R(\tilde{B}) \).

(ii) \( \tilde{A} < \tilde{B} \) if and only if \( R(\tilde{A}) < R(\tilde{B}) \).

Definition 9 [48]. A triangular fuzzy number can also be defined as \( \tilde{A} = (M, \alpha, \beta) \) which is referred to as a left right (L-R) fuzzy number. \( M \) is the central value, \( \alpha \) is the left width (spread) and \( \beta \) is the right width (spread). The membership function also has the following form:

\[
\mu_{\tilde{A}}(x) = \begin{cases} 
\frac{x-M+\alpha}{\alpha} & M - \alpha \leq x \leq M \\
\frac{M-x+\beta}{\beta} & M \leq x \leq M + \beta \\
0 & \text{otherwise}
\end{cases}
\]

Remark 1. By Definitions 2 and 6, we can see that a triangular fuzzy number \( \tilde{A} = (a, b, c) \) can be represented as \( \tilde{A} = (M, \alpha, \beta) \), where \( a = M - \alpha, b = M \) and \( c = M + \beta \).

So, based on Definitions 3–5, we have:

Definition 10. A L-R fuzzy number \( \tilde{A} = (M, \alpha, \beta) \) is called a non-negative (positive) fuzzy number if and only if \( M - \alpha \geq 0 \) \((M - \alpha > 0)\).
Definition 11. Let \( \tilde{A} = (M^A, \alpha^A, \beta^A) \) and \( \tilde{B} = (M^B, \alpha^B, \beta^B) \) be two triangular fuzzy numbers and \( \lambda \) is a non-fuzzy number. Then we have:

\[
\tilde{A} + \tilde{B} = (M^A, \alpha^A, \beta^A) + (M^B, \alpha^B, \beta^B) = (M^A + M^B, \alpha^A + \alpha^B, \beta^A + \beta^B)
\]

(3)

\[
\tilde{A} - \tilde{B} = (M^A, \alpha^A, \beta^A) - (M^B, \alpha^B, \beta^B) = (M^A - M^B, \alpha^A + \beta^B, \beta^A + \alpha^B)
\]

(4)

\[
\lambda \tilde{A} = (\lambda M^A, \lambda \alpha^A, \lambda \beta^A)
\]

(5)

And for non-negative fuzzy numbers \( \tilde{A}, \tilde{B} \) the multiplication is defined as follows:

\[
\tilde{A} \otimes \tilde{B} = (M^A M^B, M^A \alpha^B + M^B \alpha^A - a^A b^B, M^A \beta^B + M^B \beta^A + \beta^A \beta^B)
\]

Step 2: The weighted Z-number can be defined as:

\[
\tilde{Z}^w = \{(x, \mu_{\tilde{Z}^w}(x)) | \mu_{\tilde{Z}^w} = a \mu_{\tilde{A}}(x), x \in [0, 1]\}
\]

(8)

Step 3: By multiplying \( \sqrt{\alpha} \), convert the weighted Z-number into the following classical fuzzy number:

\[
\tilde{Z}' = \sqrt{\alpha} \times \tilde{Z}^w = (\sqrt{\alpha} \times a, \sqrt{\alpha} \times b, \sqrt{\alpha} \times c, \sqrt{\alpha} \times d)
\]

(9)

In this way, the Z-number is transformed into a conventional fuzzy number.
3. DEA, FDEA and FFDEA

The efficiency of a DMU is established as the ratio of sum weighted output to sum weighted input, subjected to happen between one and zero.

Let p-th DMU (DMUp) be under consideration, then the CCR model for the relative efficiency is as follows [1]:

$$\theta_p^* = \max s.t. \sum_{r=1}^{s} \frac{\sum_{i=1}^{m} u_r y_{rp}}{\sum_{i=1}^{m} v_i x_{ip}}$$

\[ (10) \]

In this model, each DMU (suppose that we have n DMUs) uses m inputs $x_{ij}$ ($i = 1, 2, \ldots, m$), to obtain s outputs $y_{rj}$ ($r = 1, 2, \ldots, s$). Here $u_r (r = 1, 2, \ldots, s)$ and $v_i (i = 1, 2, \ldots, m)$ are the weights of the i'th input and r'th output. This fractional program is calculated for every DMU to find out its best input and output weights. To simplify the computation, the nonlinear program shown as (10) can be converted to a linear program (LP) and the model is called the CCR model:

$$\theta_p^* = \max \sum_{r=1}^{s} u_r y_{rp}$$

s.t. 

$$\sum_{i=1}^{m} v_i x_{ip} = 1$$

$$\sum_{r=1}^{s} u_r y_{rj} - \sum_{i=1}^{m} v_i x_{ij} \leq 0, \quad \forall j$$

$$u_r, v_i \geq 0 \quad \forall r, i.$$

\[ (11) \]

We solve Equation (11) n-times to work out the efficiency of n DMUs. If $\theta_p^* = 1$, we say that the DMUp is efficient, otherwise it is inefficient.

Fuzzy DEA (FDEA) is a strong method for evaluating the efficiency of DMUs with imprecise information. The fuzzy CCR model is defined as follows:

$$\theta_p^* = \max \sum_{r=1}^{s} u_r \tilde{y}_{rp}$$

s.t. 

$$\sum_{i=1}^{m} v_i x_{ip} = 1$$

$$\sum_{r=1}^{s} u_r \tilde{y}_{rj} - \sum_{i=1}^{m} v_i x_{ij} \leq 0, \quad \forall j$$

$$u_r, v_i \geq 0 \quad \forall r, i.$$

\[ (12) \]

where, $\tilde{x}_{ij} (i = 1, 2, \ldots, m)$ and $\tilde{y}_{rj} (r = 1, 2, \ldots, s)$ are fuzzy inputs and fuzzy outputs for the j'th DMU (DMUj).
If all input and output data and all parameters are characterized by fuzzy numbers, we call this problem a fully fuzzy DEA (FFDEA) with the following model:

\[ \theta_p^* = \max \sum_{r=1}^{s} \tilde{u}_r \tilde{y}_{rp} \]

s.t.:

\[ \sum_{i=1}^{m} \tilde{v}_i x_{ip} = 1 \]

\[ \sum_{r=1}^{s} \tilde{u}_r y_{rj} - \sum_{i=1}^{m} \tilde{v}_i x_{ij} \leq 0, \quad \forall j \]

\[ \tilde{u}_r, \tilde{v}_i \geq 0 \quad \forall r, i \]  

\[(13)\]

where \( \tilde{x}_{ij} = (x^M_{ij}, x^a_{ij}, x^b_{ij}) \), \( \tilde{y}_{ij} = (y^M_{ij}, y^a_{ij}, y^b_{ij}) \) and their weights given by \( \tilde{u}_r = (u^M_r, u^a_r, u^b_r), \tilde{v}_r = (v^M_r, v^a_r, v^b_r) \). Using the Charnes and Cooper transformation, we have the following model:

\[ \max \quad \theta_p = \sum_{r=1}^{s} (u^M_r, u^a_r, u^b_r) \otimes (y^M_{rp}, y^a_{rp}, y^b_{rp}) \]

s.t.\((v^M_r, v^a_r, v^b_r) \otimes (x^M_{ip}, y^a_{ip}, y^b_{ip}) = (1,0,0) \)

\[ \sum_{r=1}^{s} (u^M_r, u^a_r, u^b_r) \otimes (y^M_{ij}, y^a_{ij}, y^b_{ij}) - \sum_{i=1}^{m} (u^M_r, u^a_r, u^b_r) \otimes (x^M_{ij}, y^a_{ij}, y^b_{ij}) \leq (0,0,0) \quad \forall j \]

\[ (u^M_r, u^a_r, u^b_r), (v^M_r, v^a_r, v^b_r) \geq 0 \quad \forall r, j \]

\[(14)\]

4. Sotoudeh-Anvari et al.’s Algorithm

Sotoudeh-Anvari et al. [48] proposed a regular technique to extend the DEA to the fully fuzzy environment with Z-numbers. Their model is as follows:

**Method 1.**

**Step 1:** Consider the inputs and outputs of each DMU as well as their weights by using Z-numbers. Using the Charnes and Cooper transformation we have:

\[ \theta_p^m = \max \sum_{r=1}^{s} \tilde{u}_r \tilde{y}_{rp} \]

s.t.:

\[ \sum_{i=1}^{m} \tilde{v}_i x_{ip} = 1 \]

\[ \sum_{r=1}^{s} \tilde{u}_r y_{rj} - \sum_{i=1}^{m} \tilde{v}_i x_{ij} \leq 0, \quad \forall j \]

\[ \tilde{u}_r, \tilde{v}_i \geq 0 \quad \forall r, i \]

where \( \approx \) point out the Z-numbers.
Step 2: Using the Kang et al. [50] model, convert Z-numbers into usual fuzzy numbers. Then the inputs and outputs of each DMU convert into $\tilde{x}_{ij} = (x_{ij}^M, x_{ij}^a, x_{ij}^b)$ and $\tilde{y}_{ij} = (y_{ij}^M, y_{ij}^a, y_{ij}^b)$. Furthermore, their weights will be $\tilde{w}_r = (u_r^M, u_r^a, u_r^b)$, $\tilde{v}_r = (v_r^M, v_r^a, v_r^b)$ and we have:

$$\max \quad \tilde{\theta}_p = \sum_{r=1}^{s} (u_r^M, u_r^a, u_r^b) \otimes (y_{rp}^M, y_{rp}^a, y_{rp}^b)$$

s.t.

$$\sum_{i=1}^{m} (v_i^M, v_i^a, v_i^b) \otimes (x_{ip}^M, x_{ip}^a, x_{ip}^b) = (1, 0, 0)$$

$$\sum_{i=1}^{s} (u_r^M, u_r^a, u_r^b) \otimes (x_{ij}^M, x_{ij}^a, x_{ij}^b) - \sum_{i=1}^{m} (u_r^M, u_r^a, u_r^b) \otimes (x_{ij}^M, x_{ij}^a, x_{ij}^b) \leq (0, 0, 0) \quad \forall j$$

$$(u_r^M, u_r^a, u_r^b), (v_i^M, v_i^a, v_i^b) \geq 0 \quad \forall r, i.$$

Step 3: The fuzzy DEA Equation (16) can be transformed into the following DEA model:

$$\max \quad \tilde{\theta}_p = \sum_{r=1}^{s} (u_r^M, u_r^a, u_r^b) \otimes (y_{rp}^M, y_{rp}^a, y_{rp}^b)$$

s.t.

$$\sum_{i=1}^{m} (v_i^M, v_i^a, v_i^b) \otimes (x_{ip}^M, x_{ip}^a, x_{ip}^b) = 1,$$

$$\sum_{i=1}^{s} (u_r^M, u_r^a, u_r^b) \otimes (x_{ij}^M, x_{ij}^a, x_{ij}^b) - \sum_{i=1}^{m} (u_r^M, u_r^a, u_r^b) \otimes (x_{ij}^M, x_{ij}^a, x_{ij}^b) \leq (0, 0, 0) \quad \forall j$$

$$(u_r^M, u_r^a, u_r^b), (v_i^M, v_i^a, v_i^b) \geq 0 \quad \forall r, i.$$

Step 4: Convert the fuzzy DEA Equation (17) into the following LP model:

$$\max \quad \theta_p = R(\tilde{\theta}_p) = \sum_{i=1}^{s} \left[ u_i^M (y_{ip}^M + (\frac{1}{4})y_{ip}^a - (\frac{1}{2})y_{ip}^b) + u_i^a \left( \left( \frac{1}{4} \right) y_{ip}^a \right) - u_i^b \left( \left( \frac{1}{4} \right) y_{ip}^b \right) \right]$$

s.t.

$$\sum_{i=1}^{m} \left[ v_i^M (x_{ip}^M + (\frac{1}{4})x_{ip}^a - (\frac{1}{2})x_{ip}^b) + v_i^a \left( \left( \frac{1}{4} \right) x_{ip}^a \right) - v_i^b \left( \left( \frac{1}{4} \right) x_{ip}^b \right) \right] = 1,$$

$$\sum_{i=1}^{s} \left[ u_i^M (y_{ij}^M + (\frac{1}{4})y_{ij}^a - (\frac{1}{2})y_{ij}^b) \right] + u_i^a \left( \left( \frac{1}{4} \right) y_{ij}^a \right) - u_i^b \left( \left( \frac{1}{4} \right) y_{ij}^b \right) \leq \sum_{i=1}^{m} (v_i^M (x_{ij}^M + (\frac{1}{4})x_{ij}^a - (\frac{1}{2})x_{ij}^b) + v_i^a \left( \left( \frac{1}{4} \right) x_{ij}^a \right) - v_i^b \left( \left( \frac{1}{4} \right) x_{ij}^b \right)) \quad \forall j,$$

$$u_i^M - u_i^a \geq 0, \quad \forall r,$$

$$u_i^a - \left( \frac{1}{4} \right) u_i^a \geq 0, \quad \forall r,$$

$$v_i^M - u_i^a \geq 0, \quad \forall i,$$

$$v_i^a - \left( \frac{1}{4} \right) v_i^a \geq 0, \quad \forall i,$$

$$u_i^a \geq 0, u_i^b \geq 0, \quad \forall r,$$

$$v_i^a \geq 0, v_i^b \geq 0, \quad \forall i.$$

Step 5: Run Equation (18) and obtain the optimal solutions of $u_i^{M^r}, u_i^a, u_i^b, v_i^{M^r}, v_i^a$ and $v_i^b$.

5. Main Results

In this section, we explain the shortcomings of Sotoudeh-Anvari et al.’s Algorithm [48] and present the new Algorithm.
5.1. The Shortcoming of the Existing Algorithm

From Definition 11, if \( \tilde{A} = (M^A, \alpha^A, \beta^A) \) and \( \tilde{B} = (M^B, \alpha^B, \beta^B) \) are two non-negative triangular fuzzy numbers then:

\[
\tilde{A} \otimes \tilde{B} = (M^A M^B, M^A \alpha^B + M^B \alpha^A, M^A \beta^B + M^B \beta^A + \alpha^A \beta^B).
\]

Nonetheless, it is evident from Step 3 of Method 1 that Sotoudeh-Anvari et al. [38], have utilized the wrong product:

\[
\tilde{A} \otimes \tilde{B} = (M^A(M^B + \beta^B - \alpha^B), \beta^A M^B, \alpha^A M^B),
\]
to transform the fuzzy DEA Equation (16) into the fuzzy DEA Equation (17). Henceforth, Method 1, proposed by Sotoudeh-Anvari et al. [48], is not substantial in its present frame.

5.2. Improvement Model for FFDEA with Z-Numbers

In this section, to remove the mentioned shortcoming, we proposed an improved model for fully fuzzy DEA with Z-numbers.

Method 2.

Step 1: Consider the DEA model that the inputs and outputs of each DMU as well as their weights are Z-numbers.

Step 2: Using Kang et al.’s [50] model, convert Z-numbers into usual fuzzy numbers and obtain a fully fuzzy DEA model with triangular fuzzy numbers.

Step 3: Using Definition 11, the fully fuzzy DEA model of Step 2 can be transformed into the following model:

\[
\begin{align*}
\text{max} & \quad \tilde{\theta}_p = \sum_{r=1}^{s} \left( u_r^M y_r^M + u_r^M y_r^\alpha - u_r^M y_r^\beta - u_r^\alpha y_r^\beta - u_r^\alpha y_r^\beta \right) \\
\text{s.t.} & \quad \sum_{i=1}^{m} \left( c_{ij}^M x_{ij}^M + x_{ij}^M \alpha^B - x_{ij}^M \beta^B + x_{ij}^M \beta^B \right) \approx 1, \\
& \sum_{i=1}^{m} \left( u_r^M y_{rj}^M + u_r^M y_{rj}^\alpha - u_r^M y_{rj}^\beta \right) \leq (19)
\end{align*}
\]

Step 4: Based on Definitions 7 and 8, convert the fuzzy DEA Equation (19) into the following model:

\[
\begin{align*}
\text{max} & \quad \theta_p = R(\tilde{\theta}_p) = \sum_{i=1}^{n} R((u_i^M y_i^M + u_i^M y_i^\alpha - u_i^M y_i^\beta - u_i^\alpha y_i^\beta - u_i^\alpha y_i^\beta)) \\
\text{s.t.} & \quad \sum_{i=1}^{n} R((c_{ij}^M x_{ij}^M + x_{ij}^M \alpha^B - x_{ij}^M \beta^B + x_{ij}^M \beta^B)) = R(1,1,1), \\
& \sum_{i=1}^{n} R((u_i^M y_{ij}^M + u_i^M y_{ij}^\alpha - u_i^M y_{ij}^\beta)) \leq \sum_{i=1}^{n} R((c_{ij}^M x_{ij}^M + x_{ij}^M \alpha^B - x_{ij}^M \beta^B + x_{ij}^M \beta^B)) \quad \forall j \\
& R(u_i^M, u_i^\alpha, u_i^\beta) \geq (0,0,0), R(c_{ij}^M, c_{ij}^\alpha, c_{ij}^\beta) \geq (0,0,0) \quad \forall r, i \\
u_i^\alpha - u_i^\alpha \geq 0, \forall r, i \\
u_i^\alpha - u_i^\alpha \geq 0, \forall i, i \\
u_i^\alpha \geq 0, u_i^\alpha \geq 0, \forall r \\
u_i^\alpha \geq 0, u_i^\alpha \geq 0, \forall i.
\end{align*}
\]
Step 5: Based on Definition 12, convert Equation (20) into the following model:

\[
\begin{align*}
\max_{\mathbf{y}} & \quad \theta_{\mathbf{y}} = R(\theta_{\mathbf{y}}) = \sum_{i=1}^{\infty} \left[ u_i^{\alpha} y_i^{\alpha} + \frac{1}{4} y_i^{\alpha} u_i^{\beta} \right] - \frac{1}{4} u_i^{\alpha} y_i^{\alpha} - \frac{1}{4} y_i^{\alpha} u_i^{\beta} - u_i^{\alpha} y_i^{\alpha} \\
\text{s.t.} & \quad \sum_{i=1}^{\infty} \left[ u_i^{\alpha} y_i^{\alpha} + \frac{1}{4} y_i^{\alpha} u_i^{\beta} \right] - \frac{1}{4} \left[ u_i^{\alpha} y_i^{\alpha} + x_i^{\alpha} u_i^{\beta} \right] = \frac{1}{4} \left[ u_i^{\alpha} y_i^{\alpha} - x_i^{\alpha} y_i^{\beta} \right], \quad \forall j \\
& \quad u_i^{\alpha} - x_i^{\alpha} \geq 0, \quad \forall r \\
& \quad v_i^{\alpha} - \left( \frac{1}{4} v_i^{\beta} + \left( \frac{1}{4} v_i^{\beta} \right) \right) v_i^{\alpha} \geq 0, \quad \forall r \\
& \quad v_i^{\alpha} - u_i^{\alpha} \geq 0, \quad \forall i \\
& \quad v_i^{\alpha} - \left( \frac{1}{4} v_i^{\beta} + \left( \frac{1}{4} v_i^{\beta} \right) \right) v_i^{\alpha} \geq 0, \quad \forall i \\
& \quad u_i^{\alpha} \geq 0, u_i^{\beta} \geq 0, \quad \forall r \\
& \quad v_i^{\alpha} \geq 0, v_i^{\beta} \geq 0, \quad \forall i.
\end{align*}
\]

(21)

Step 6: Obtain the optimal solutions of \(u_i^{\alpha}, u_i^{\beta}, v_i^{\alpha}, v_i^{\beta}, t_i^{\alpha} \) and \(t_i^{\beta}\).

6. Numerical Example

Sotoudeh-Anvari et al. [48], tackled the existing problem taken from Guo and Tanaka [52] to represent their proposed approach. However, as discussed in Section 5, there are some shortcomings in Method 1. Therefore, the results of Sotoudeh-Anvari et al. [48] are likewise not correct. In this section, the correct consequences of this problem are solved by Method 2.

Problem 1. Consider five DMUs with two inputs and two outputs where all the input and output data are designed as Z-numbers (see Table 1).

Table 1. Five decision-making units (DMUs) with two Z-number inputs and two Z-number outputs.

<table>
<thead>

</tr>
</tbody>
</table>

Now, we use Method 2 to solve the performance assessment problem. For example, Method 2 for DMU_A can be used as follows:

**Step 1:** Obtain a fully fuzzy DEA model with triangular fuzzy numbers:

\[
\max \quad \bar{\theta}_A \approx (2.6, 0.2, 0.2, 2) \otimes (u^M_1, u^u_1, u^l_1) + (4.1, 0.3, 0.3) \otimes (u^M_2, u^u_2, u^l_2)
\]

s.t.

\[
\begin{align*}
& (4,0.5,0.5) \otimes (v^M_1, v^u_1, v^l_1) + (2,1,0.2,0.2) \otimes (v^M_2, v^u_2, v^l_2) = 1, \\
& (2,6,0,2,0,2) \otimes (u^M_1, u^u_1, u^l_1) + (4,1,0,3,0,3) \otimes (u^M_2, u^u_2, u^l_2) - \\
& (4,0,5,0,5) \otimes (v^M_1, v^u_1, v^l_1) + (2,1,0,2,0,2) \otimes (v^M_2, v^u_2, v^l_2) \leq (0,0,0), \\
& (2,2,0,0) \otimes (u^M_1, u^u_1, u^l_1) + (3,5,0,2,0,2) \otimes (u^M_2, u^u_2, u^l_2) - \\
& (2,9,0,0) \otimes (v^M_1, v^u_1, v^l_1) + (1,5,0,1,0,1) \otimes (v^M_2, v^u_2, v^l_2) \leq (0,0,0), \\
& (3,2,0,5,0,5) \otimes (u^M_1, u^u_1, u^l_1) + (5,1,0,8,0,8) \otimes (u^M_2, u^u_2, u^l_2) - \\
& (4,9,0,5,0,5) \otimes (v^M_1, v^u_1, v^l_1) + (2,6,0,4,0,4) \otimes (v^M_2, v^u_2, v^l_2) \leq (0,0,0), \\
& (2,5,0,2,0,4) \otimes (u^M_1, u^u_1, u^l_1) + (5,7,0,9,0,9) \otimes (u^M_2, u^u_2, u^l_2) - \\
& (4,1,0,7,0,7) \otimes (v^M_1, v^u_1, v^l_1) + (2,3,0,1,0,1) \otimes (v^M_2, v^u_2, v^l_2) \leq (0,0,0), \\
& (5,1,0,7,0,7) \otimes (u^M_1, u^u_1, u^l_1) + (7,4,0,9,0,9) \otimes (u^M_2, u^u_2, u^l_2) - \\
& (6,1,0,2,1) \otimes (v^M_1, v^u_1, v^l_1) + (4,1,0,5,0,5) \otimes (v^M_2, v^u_2, v^l_2) \leq (0,0,0), \\
& (u^M_1, u^u_1, u^l_1), (v^M_1, v^u_1, v^l_1) \geq 0 \quad \forall r, i
\]

**Step 2:** Using the Definition 11, the fully fuzzy DEA model of Step 2 can be transformed into the following model:

\[
\max \quad \bar{\theta}_A \approx (2.6u^M_1, 0.2u^u_1, 2.4u^l_1, 0.2u^M_2, 2.8u^l_2) + (4.1u^M_1, 0.3u^u_1, 3.8u^l_1, 0.3u^M_2 + 4.4u^l_2)
\]

s.t.

\[
\begin{align*}
& (4u^M_1, 0.5u^u_1, 3.5u^l_1, 0.5u^M_2 + 4.5u^l_2) + (2.1u^M_3, 0.2u^M_3, 1.9u^u_3, 0.2u^M_3 + 2.3u^l_3) \approx (1, 1, 1), \\
& (2.6u^M_1, 0.2u^M_2, 2.4u^u_1, 0.2u^M_2 + 2.8u^u_2) + (4.1u^M_1, 0.3u^M_2 + 3.8u^u_1, 0.3u^M_2 + 4.4u^u_2) - \\
& (4u^M_1, 0.5u^M_1, 3.5u^u_1, 0.5u^M_1 + 4.5u^u_1) + (2.1u^M_1, 0.2u^M_1 + 1.9u^M_1, 0.2u^M_1 + 2.3u^u_1) \leq (0, 0, 0), \\
& (2.6u^M_1, 2.2u^u_1, 2.2u^u_1) + (3.5u^M_1, 0.2u^u_1 + 3.3u^u_1, 0.2u^u_1 + 3.7u^u_1) - \\
& (2.9u^M_1, 2.9u^u_1, 2.9u^u_1) + (1.5u^M_1, 0.1u^M_1, 1.4u^u_1, 0.1u^M_1 + 1.6u^u_1) \leq (0, 0, 0), \\
& (3.2u^M_1, 0.5u^u_1 + 2.7u^u_1, 0.5u^u_1 + 3.7u^u_1) + (5.1u^M_1, 0.8u^u_1 + 4.3u^u_1, 0.8u^u_1 + 5.9u^u_1) - \\
& (4.9u^M_1, 0.5u^M_1 + 4.4u^u_1, 0.5u^M_1 + 4.5u^u_1) - (2.6u^M_1, 0.4u^M_1 + 2.2u^u_1, 0.4u^M_1 + 3.6u^u_1) \leq (0, 0, 0), \\
& (2.5u^M_1, 0.2u^M_2 + 2.3u^u_1, 0.4u^M_2 + 2.9u^u_1) + (5.7u^M_1, 0.2u^M_1 + 5.5u^u_1, 0.2u^M_1 + 5.9u^u_1) - \\
& (4.1u^M_1, 0.7u^M_1 + 3.4u^u_1, 0.7u^M_1 + 4.8u^u_1) - (2.3u^M_1, 0.1u^M_1 + 2.2u^u_1, 0.1u^M_1 + 2.4u^u_1) \leq (0, 0, 0), \\
& (5.1u^M_1, 0.7u^M_1 + 4.4u^u_1, 0.7u^M_1 + 5.8u^u_1) + (7.4u^M_1, 0.9u^M_1 + 6.5u^u_1, 0.9u^M_1 + 8.3u^u_1) - \\
& (6.1u^M_1, 0.2u^M_1 + 5.9u^u_1, 0.4u^M_1 + 7.1u^u_1) - (4.1u^M_1, 0.5u^M_1 + 3.6u^u_1, 0.5u^M_1 + 4.6u^u_1) \leq (0, 0, 0), \\
& (u^M_1, u^u_1, u^l_1), (v^M_1, v^u_1, v^l_1) \geq 0 \quad \forall r, i
\]
Step 3: Based on Definitions 7 and 8, convert the above fuzzy DEA model to the following model:

\[ \begin{align*}
\max \quad & \theta_A = R(\theta_A) = R \left( (2.6u_M^1 - 0.6u_a^1 + 0.7u^\beta_1) + (4.1u_2^M - 0.95u_a^2 + 1.1u^\beta_2) \right) \\
\text{s.t.} \quad & R \left( (4v_1^M - 0.5v_a^1 + 3.5v^\beta_1 + 4.5v_2^\beta) + (2.1v_2^M - 0.2v_a^2 + 1.9v^\beta_2 + 2.3v_2^\beta) \right) = R(1,1,1), \\
& \left( (2.6u_M^1 - 0.2u_a^1 + 0.2u^\beta_1) + (4.1u_2^M - 0.3u_a^2 + 3.8v_2^\beta) + (4.4u^\beta_1) - (4v_1^M, 0.5v_a^1 + 3.5v^\beta_1 + 4.5v_2^\beta) - (2.1v_2^M, 0.2v_a^2 + 1.9v^\beta_2 + 2.3v_2^\beta) \right) \leq R(0,0,0), \\
& \left( (2.2u_M^1, 2.2u_a^1, 2.2u^\beta_1, 3.5v_a^1, 0.2u_a^2 + 3.3v_2^\beta, 0.2u^\beta_1 + 3.7u_2^\beta) - (2.9v_1^M, 2.9v_a^1, 2.9v^\beta_1) - (1.5v_1^M, 0.1v_a^1 + 1.4v^\beta_1, 0.1v_a^2 + 1.6v_a^1) \right) \leq R(0,0,0), \\
& \left( (3.2u_M^1, 0.5v_a^1 + 2.7v^\beta_1, 0.5v_a^2 + 3.7v_2^\beta) - (4.9v_1^M, 0.5v^\beta_1 + 4.4v_2^\beta, 0.5v_a^1 + 5.4v^\beta_1) - (2.6v_1^M, 0.4v_a^1 + 2.2v_2^\beta, 0.4v^\beta_1 + 3.2v_a^1) \right) \leq R(0,0,0), \\
& \left( (2.5u_M^1, 0.2u_a^1 + 2.3v_1^\beta, 0.2u^\beta_1 + 2.9v_a^1, 3.5v_a^2, 0.2u_a^2 + 5.5v_2^\beta, 0.2u^\beta_1 + 5.9u_2^\beta) - (4.1v_1^M, 0.7v_1^\beta + 3.4v_a^1, 0.7v_2^\beta + 4.8v^\beta_1) - (2.3v_1^M, 0.1v_1^\beta + 2.2v_2^\beta, 0.1v^\beta_1 + 2.4v_a^1) \right) \leq R(0,0,0), \\
R(u_M^1, u_a^1, u^\beta_1) & \geq R(0,0,0), \quad \forall r, \\
R(u_M^1, u_a^1, u^\beta_1) & \geq R(0,0,0), \quad \forall r, \\
\theta_M^r \geq 0, \quad \forall v, \\
\theta_M^r \geq 0, \quad \forall v, \\
\theta_M^r \geq 0, \quad \forall v, \\
\theta_M^r \geq 0, \quad \forall v.
\end{align*} \]

Step 4: Based on Definition 12, convert the above model to the following model:

\[ \begin{align*}
\max \quad & \theta_A = \left( (2.6u_M^1 - 0.6u_a^1 + 0.7u^\beta_1) + (4.1u_2^M - 0.95u_a^2 + 1.1u^\beta_2) \right) \\
\text{s.t.} \quad & \left( (4v_1^M - 0.875v_a^1 + 1.125v^\beta_1) + (2.1v_2^M - 0.475v_a^2 + 0.575v^\beta_2) \right) = 1, \\
& (2.6u_M^1 - 0.6u_a^1 + 0.7u^\beta_1) + (4.1u_2^M - 0.95u_a^2 + 1.1u^\beta_2) - \left( (4v_1^M - 0.875v_a^1 + 1.125v^\beta_1) + (2.1v_2^M - 0.475v_a^2 + 0.575v^\beta_2) \right) \leq 0, \\
& (2.2u_M^1 - 0.55u_a^1 + 0.55u^\beta_1) + (3.5u_a^2 - 0.825u_a^1 + 0.925u^\beta_1) - \left( (2.9v_1^M - 0.725v_a^1 + 0.725v^\beta_1) + (1.5v_2^M - 0.35v_a^2 + 0.4v^\beta_2) \right) \leq 0, \\
& (3.2u_M^1 - 0.675u_a^1 + 0.925u^\beta_1) + (5.1u_2^M - 1.075u_a^2 + 1.475u^\beta_2) - \left( (4.9v_1^M - 1.11v_a^1 + 1.35v^\beta_1) + (2.6v_2^M - 0.55v_a^2 + 0.75v^\beta_2) \right) \leq 0, \\
& (2.55u_M^1 - 0.575u_a^1 + 0.725u^\beta_1) + (5.7u_2^M - 1.2u_a^2 + 1.65u^\beta_2) - \left( (4.1v_1^M - 0.855v_a^1 + 1.2v^\beta_1) + (2.3v_2^M - 0.55v_a^2 + 0.6v^\beta_2) \right) \leq 0, \\
& (5.1u_M^1 - 1.1u_a^1 + 1.45u^\beta_1) + (7.4u_2^M - 1.625u_a^2 + 2.075u^\beta_2) - \left( (6.3v_1^M - 1.475v_a^1 + 1.775v^\beta_1) + (4.1v_2^M - 0.9v_a^2 + 1.15v^\beta_2) \right) \leq 0, \\
& u_M^r - 0.25u_a^1 + 0.25u^\beta_1 \geq 0, u_2^M - 0.25u_a^2 - 0.25u^\beta_2 \geq 0, \\
& v_1^M - 0.25v_a^1 + 0.25v^\beta_1 \geq 0, v_2^M - 0.25v_a^2 + 0.25v^\beta_2 \geq 0, \\
& u_M^r - u_a^1 \geq 0, u_2^M - u_a^2 \geq 0, \\
& v_1^M - v_a^1 \geq 0, v_2^M - v_a^2 \geq 0, \\
& u_a^r \geq 0, u_a^\beta \geq 0, \quad r = 1,2, \\
& v_a^r \geq 0, v_a^\beta \geq 0, \quad i = 1,2.
\end{align*} \]
After computations with Lingo, we have the following optimal information for DMU_A:

\[ u^*_1 = (0.08682, 0.08682, 0.36267), \ u^*_2 = (0.107402, 0, 0), \ v^*_1 = (0.15182, 0, 0), \ v^*_2 = (0.132123, 0, 0.20046). \]

And,

\[ \tilde{\theta}^*_{\text{A}} = (\tilde{\theta}^M_{\text{A}}, \tilde{\theta}^\ell_{\text{A}}, \tilde{\theta}^e_{\text{A}}) = (0.6660, 0.2579, 1.0651). \]

Similarly, for other DMUs, we report the results in Table 4.

Table 4. Fuzzy efficiencies of the other DMUs.

<table>
<thead>

</tr>
</tbody>
</table>

By these results, we can see that DMU_A is inefficient, and the others are efficient. Further, we have used Wang et al.’s model [28] for comparing and ranking fuzzy efficiencies.

From Table 5, the DMUs are fully ranked in terms of their fuzzy efficiencies as follows:

\[ B = C = E \geq D \geq A. \]

Table 5. The matrix of the degree of preference for fuzzy efficiencies obtained by model [28].

According to our model, DMU_B, DMU_C and DMU_E are efficient. However, by the model of [48], we can see that DMU_B, DMU_D and DMU_E are efficient. Even if the results were the same, because the model of [48] uses the wrong strategy, it would still not be valid. We take note that this example is utilized to demonstrate the computational procedure of the proposed technique and such a comparison is insignificant. Although the suggested procedure has been employed to a numerical case, the same frames could be used, with some adjustment, to other benchmarking problems.

7. Conclusions and Future Work

Within the past few years, a developing interest has appeared in fully fuzzy DEA (FFDEA) and presently there are numerous strategies to solve it. However, in original fuzzy sets, the certainty of the information is approximately ignored. Z-number is a suitable measure for comprehensive explanation of real-life information and has that extra ability of being able to depict uncertain information. This paper explains the drawbacks of Sotoudeh-Anvari et al.’s method [48] in the fully fuzzy DEA to rank DMUs with imprecise data. We show that the mentioned method did not consider the fuzzy axioms, so it may produce incorrect rankings in some cases. To remove the existing drawbacks, we presented a new fully fuzzified DEA, where all decision parameters and variables are Z-numbers. Based on our results, we can see that Sotoudeh-Anvari et al.’s method [48] should not be used for evaluating the best relative fuzzy efficiencies of DMUs. Furthermore, our model used Wang et al.’s model [28] for...
comparing and ranking fuzzy efficiencies. It is explained that our model provides the right evaluation of the relative efficiency of a DMU under ambiguous circumstances and gives more reliable results. In spite of the fact that the model, arithmetic operations and results introduced here have exhibited the viability of our approach, it might be additionally applied in other fuzzy DEA problem such as network FFDEA, FFDEA with common weights, and FFDEA with undesirable outputs. For future work, we plan to consider these issues.

Author Contributions: A.N. and S.E.N. contributed to generating the research ideas, designed the research, analyzed the data and developed the paper. M.F. and M.J. provided extensive advice throughout the study regarding the research design, methodology, and revised the manuscript. All the authors have read and approved the final manuscript.

Funding: This research received no external funding.

Acknowledgments: The authors would like to thank all the three reviewers and the editor for their valuable suggestions which have led to an improvement in both the quality and clarity of this paper.

Conflicts of Interest: The authors declare no conflict of interest.
